Directions for Q.Nos. 101-105 : Read the passage given below and answer the questions based on it.

It is frequently assumed that the mechanization of work has a revolutionary effect on the lives of the people who operate the new machines and on the society into which the machines have been introduced. For example, it has been suggested that the employment of women in industry took them out of the household, their traditional sphere, and fundamentally altered their position in society. In the nineteenth century, when women began to enter factories, Jules Simon, a French politician, warned that by doing so, women would give up their femininity. Friedrich Engels, however, predicted that women would be liberated from the "social, legal, and economic subordination" of the family by technological developments that

(20)   (*Continued*)

made possible the recruitment of "the whole female sex ...into public industry". Observers thus differed concerning the social desirability of mechanization's effects, but they agreed that it would transform women's lives.

Historians, particularly those investigating the history of women, now seriously question this assumption of transforming power. They conclude that such dramatic technological innovations as the spinning jenny, the sewing machine, the typewriter, and the vacuum cleaner have not resulted in equally dramatic social changes in women's economic position or in the prevailing evaluation of women's work. The employment of young women in textile mills during the Industrial Revolution was largely an extension of an older pattern of employment of young, single women as domestics. It was not the change in office technology, but rather the separation of secretarial work, previously seen as an apprenticeship for beginning managers, from administrative work that in the 1880's created a new class of "dead end " jobs, thenceforth considered "women's work." The increase in the numbers of married women employed.

(1) The effects of the mechanization of women's work have not borne out the frequently held assumption that new technology is inherently revolutionary.

(3) Mechanization has caused the nature of women's work to change since the Industrial Revolution.

(4) The mechanization of work creates whole new classes of jobs that did not previously exist.

102. In the nineteenth century, when women began to enter in the factories there were different reactions, but there was an agreement that

(1) Mechanization of work will not have any impact on the lives of women.

(2) Mechanization of work will have very limited impact on the lives of women.
