### Passage-I

The term e-commerce embraces all the ways of transacting business via electronic data. But it is most closely identified with commerce transacted over the internet, and it is the internet that has put e-commerce near the top of the corporate agenda in the first years of the 21<sup>st</sup> century. E-commerce is merely an **elision** of electronic commerce, but it embodies a revolutionary idea: that electronic commerce is qualitatively different from ordinary time-worn commerce, that (in the jargon) there is a paradigm shift in the way that business is conducted in the world of e-commerce. Doing business via the internet is not only much quicker and much cheaper than other methods, it is also thought to overturn old rules about time, space and price. There is the much-vaunted death of distance: a customer 10,000 miles away becomes as accessible as one around the corner. And e-commerce has created the phenomenon of the long tail.

Furthermore, economies of scale are undermined. In its April 1999 report "Making Open Finance Pay", Forrester Research, an American research company gave examples of the way in which the internet had altered the pricing structure of a number of industries, particularly those with high information content. Before the advent of the internet it cost \$ 100 to make an equity market order. Afterwards it cost just \$ 15, an 85% fall in price, far more than could ever have been gleaned from traditional economies of scale. This is a revolution for organisations whose structures and strategies have built-in assumptions about relationships between price and volume. Electronic commerce has grown rapidly. Online sales in the United States are reckoned to have grown by some 18% in 2017. The country's five largest online retailers (often called e-tailers) were Amazon, Staples, Office Depot, Dell and Hewlett-Packard. Dell became a market leader in computers through early use of the internet to sell goods and services direct to consumers, and to buy components from suppliers.

Financial service offerings over the internet have also sprouted like mushroom, although security issues have imposed some restraint on the industry. At Charles Schwab, an American retail brokerage firm, it took just three years for online dealing to account for more than half of all its securities trading. For banks, the economic logic of e-commerce is compelling. It has been estimated that a banking transaction over the telephone costs half as much as the same transaction conducted over a counter in a traditional branch, and that an ATM transaction costs a quarter as much. But a banking transaction over the internet costs a mere 1% of an over-the-counter transaction at a branch. E-commerce also allows unknown firms to establish new businesses cheaply and rapidly, and to compete with old-timers. This they do not provide only by cutting prices and offering wider choices, but also by allowing consumers to make real-time price comparisons and to switch rapidly (and frequently) to the cheapest provider. This control that consumers have over prices has led some analysts to predict that e-commerce can at best only ever be a low-margin business, and at worst a no-margin business.

  - (2) Because volumes cannot be expected in e-commerce, cost per transaction may remain more or less the same.
  - (3) Because e-commerce has the potential to create large volumes which may eventually push up the cost per transaction.

#### Passage-II

In terms of the total energy consumed by different sectors, the largest consumer is understandably the industrial sector, which accounts for nearly half the total energy used in the country today. This is followed by the transport sector which consumes about 25%, the household sector (about 14%) and the agricultural sector (about 9%). This last sector has shown considerable increase in energy use over the last four decades. Among the primary fuels, the relative proportion of coal has dropped from nearly 80% to 40% and that of oil has gone up from 17% to 44% over the same period.

Total energy consumption in India today is equivalent to 291 million tons of oil of which 26% comes from wood. On a per capita basis it works out to about one litre of oil per day, which is extremely low by international standards. The future energy demand depends upon the level of development envisaged and also on the sections of people to be affected by it.

The energy disparity between the urban and the rural population is at present as wide as between nations on a worldwide scale. There is apparently a greater need to provide energy in the rural areas and to improve the efficiency of energy use than merely to increase the national figures for energy consumption limiting its use to those who are getting the bulk share already.

With the projected rate of population growth, improving upon the per capita energy consumption is a Herculean task as our coal reserves and the capacity to import oil cannot be increased beyond a point. There is clearly no escape from the utilisation of renewable energy sources in a big way if the gap between the desired levels of energy supply and available resources has to be kept at the minimum.

- (1) Only A                      (2) Only B                      (3) Only C                      (4) Both B and C

(4) None of these

### Passage-III

Work expands so as to fill the time available for its completion. The general recognition of this fact is shown in the proverbial phrase, 'It is the busiest man who has time to spare.' Thus, an elderly lady at leisure can spend the entire day writing a postcard to her niece. An hour will be spent in finding the postcard, another hunting for spectacles, half an hour to search for the address, an hour and a quarter in composition and twenty minutes in deciding whether or not to take an umbrella when going to the pillar box in the street. The total effort that would occupy a busy man for three minutes, all told, may in this fashion leave another person completely exhausted after a day of doubt, anxiety and toil.

- (1) The more work there is to be done, the more the time needed.  
(2) Whatever time is available for a given amount of work, all of it will be used.  
(3) If you have more time, you can do more work.  
(4) If you have some important work to do, you should always have some additional time.

#### Passage-IV

Recent technological advancement in manned and unmanned undersea vehicles, overcome some of the limitations of divers equipment. Without a vehicle, divers often became sluggish and their mental concentration was limited. Because of undersea pressure that affected their mind, concentration among divers was difficult or impossible. But today, most oceanographers make observations by means of instruments that are lowered into the ocean or from samples taken from the water. Direct observations of the ocean floor are made not only by the divers, but also by deep-diving submarines. Some of these submarines can dive to depths of more than several miles and cruise at depths of 15 thousand feet. Radio equipped buoys can be operated by remote control in order to transmit information back to land-based laboratories including data about water temperature, currents and weather. Some of mankind's most serious problems, especially those concerning energy and food may be solved with the help of observations made possible by these undersea vehicles.

20. This passage suggests that the successful exploration of the ocean depends upon

### Passage-V

A new US study has warned that adolescents who take performance enhancing anabolic steroids are more likely to have adverse neural and behavioural consequences, like aggression and moodiness, because of the steroids' affect on the underdeveloped brain and the nervous system. The study by Northeastern University in the US, centred around a brain chemical called serotonin, which is linked to mood. Lower levels of serotonin are associated with depression and aggression. For the study, experiments were carried out on a strain of Syrian hamsters. This breed has similar neurological circuitry to humans, so experts felt it might be a good model for humans in this respect. The hamsters were given a high dose of anabolic steroids over the course of a month—which corresponded to five years' repeated dosage in humans. The researchers found that the hamsters were more aggressive than those not given steroids and these aggressive tendencies were mellowed if Prozac—a drug which boosts serotonin “uptake”—was given. However, subsequent analysis showed significantly lower than normal serotonin levels in the neural connections of the hamster's brains. This suggests there may be a longer-term effect of taking steroids while the brain is still developing. Professor Richard Melloni, who helped run the study, was quoted as saying by BBC : “We know testosterone or steroids affect the development of serotonin nerve cells, which, in turn, decreases serotonin availability in the brain. The serotonin neural system is developing during adolescence and the use of anabolic steroids during this critical period appears to have immediate neural and behavioural consequences.”
