

I am a student in the final year of Computer Science and Engineering at XXXX University in Delhi. I aspire to do my software engineering to obtain a world-class degree and my research brought me to the conclusion that Swedish universities are the best education providers in my field of interest.

Since my childhood, I had a great interest in electrical, electronics, and science. Opening toys, repairing things at home without having any knowledge and experience was something I enjoyed. My passion for science and mathematics was visible in my studies also due to that I opted for a non-medical stream in my secondary education and came out meritorious. In the engineering entrance, I was in the top 10% and was able to get admission to the university of my choice.

Once I started my classes and the experiential learning at the university I realized that this area has so much to learn and there is no dearth of using one's creativity in solving things or making life easier with the vast and fast-changing technology in this field too.

The languages like C, C++, and the new application taught me how theory can be put to practice and showed me the way to the ocean of knowledge that I still need to immerse in. I child playing with hardware to understand the technique of software today I have turned into an individual who has the zeal to learn the in-depth details of Software engineering and excel in the innovation for the community, country, and for my personal satisfaction too.

I am fortunate to get a chance to study in one of the best institutions under the best possible faculty as my professors always encouraged me to think and do things out of the box. They showed me the way of achieving excellence and the diligence and hard work that one needs to do to acquire the same. Understanding my hunger to be on the top of these changing technologies they also suggested that I should earn my MS from a reputed world-class institution like XXXXXXXXX in Sweden.

I also strongly feel that a master's degree in software engineering will help me raise my level of knowledge and competence and will also provide me an edge in this competitive world to have more space to be innovative and experimental. The areas like computer engineering, computer science, mathematics, testing methodologies, and quality management will provide me the thorough knowledge and skills to be a good software engineer.

I have searched through all the major institutions and the countries before making up my mind for XXXX university mainly due to the experiential learning and research methodologies used by the institution that is not only effective but provides enough time and expertise for a student to get a hold on them. I honestly feel that if I would be able to get admission in your esteemed institution, I shall be able to realize my dreams and objectives as the length and breadth of knowledge that I can gain here would not be available anywhere else.

I have enclosed my academic record and the co-curricular activities record along with the admission requirements of master's in software engineering specified at your website and am hopeful to receive an affirmative reply to my application.
