CBSE Class 12 Physics Answer Key 2015 (March 9, Set 1 - 55/1/1/D)

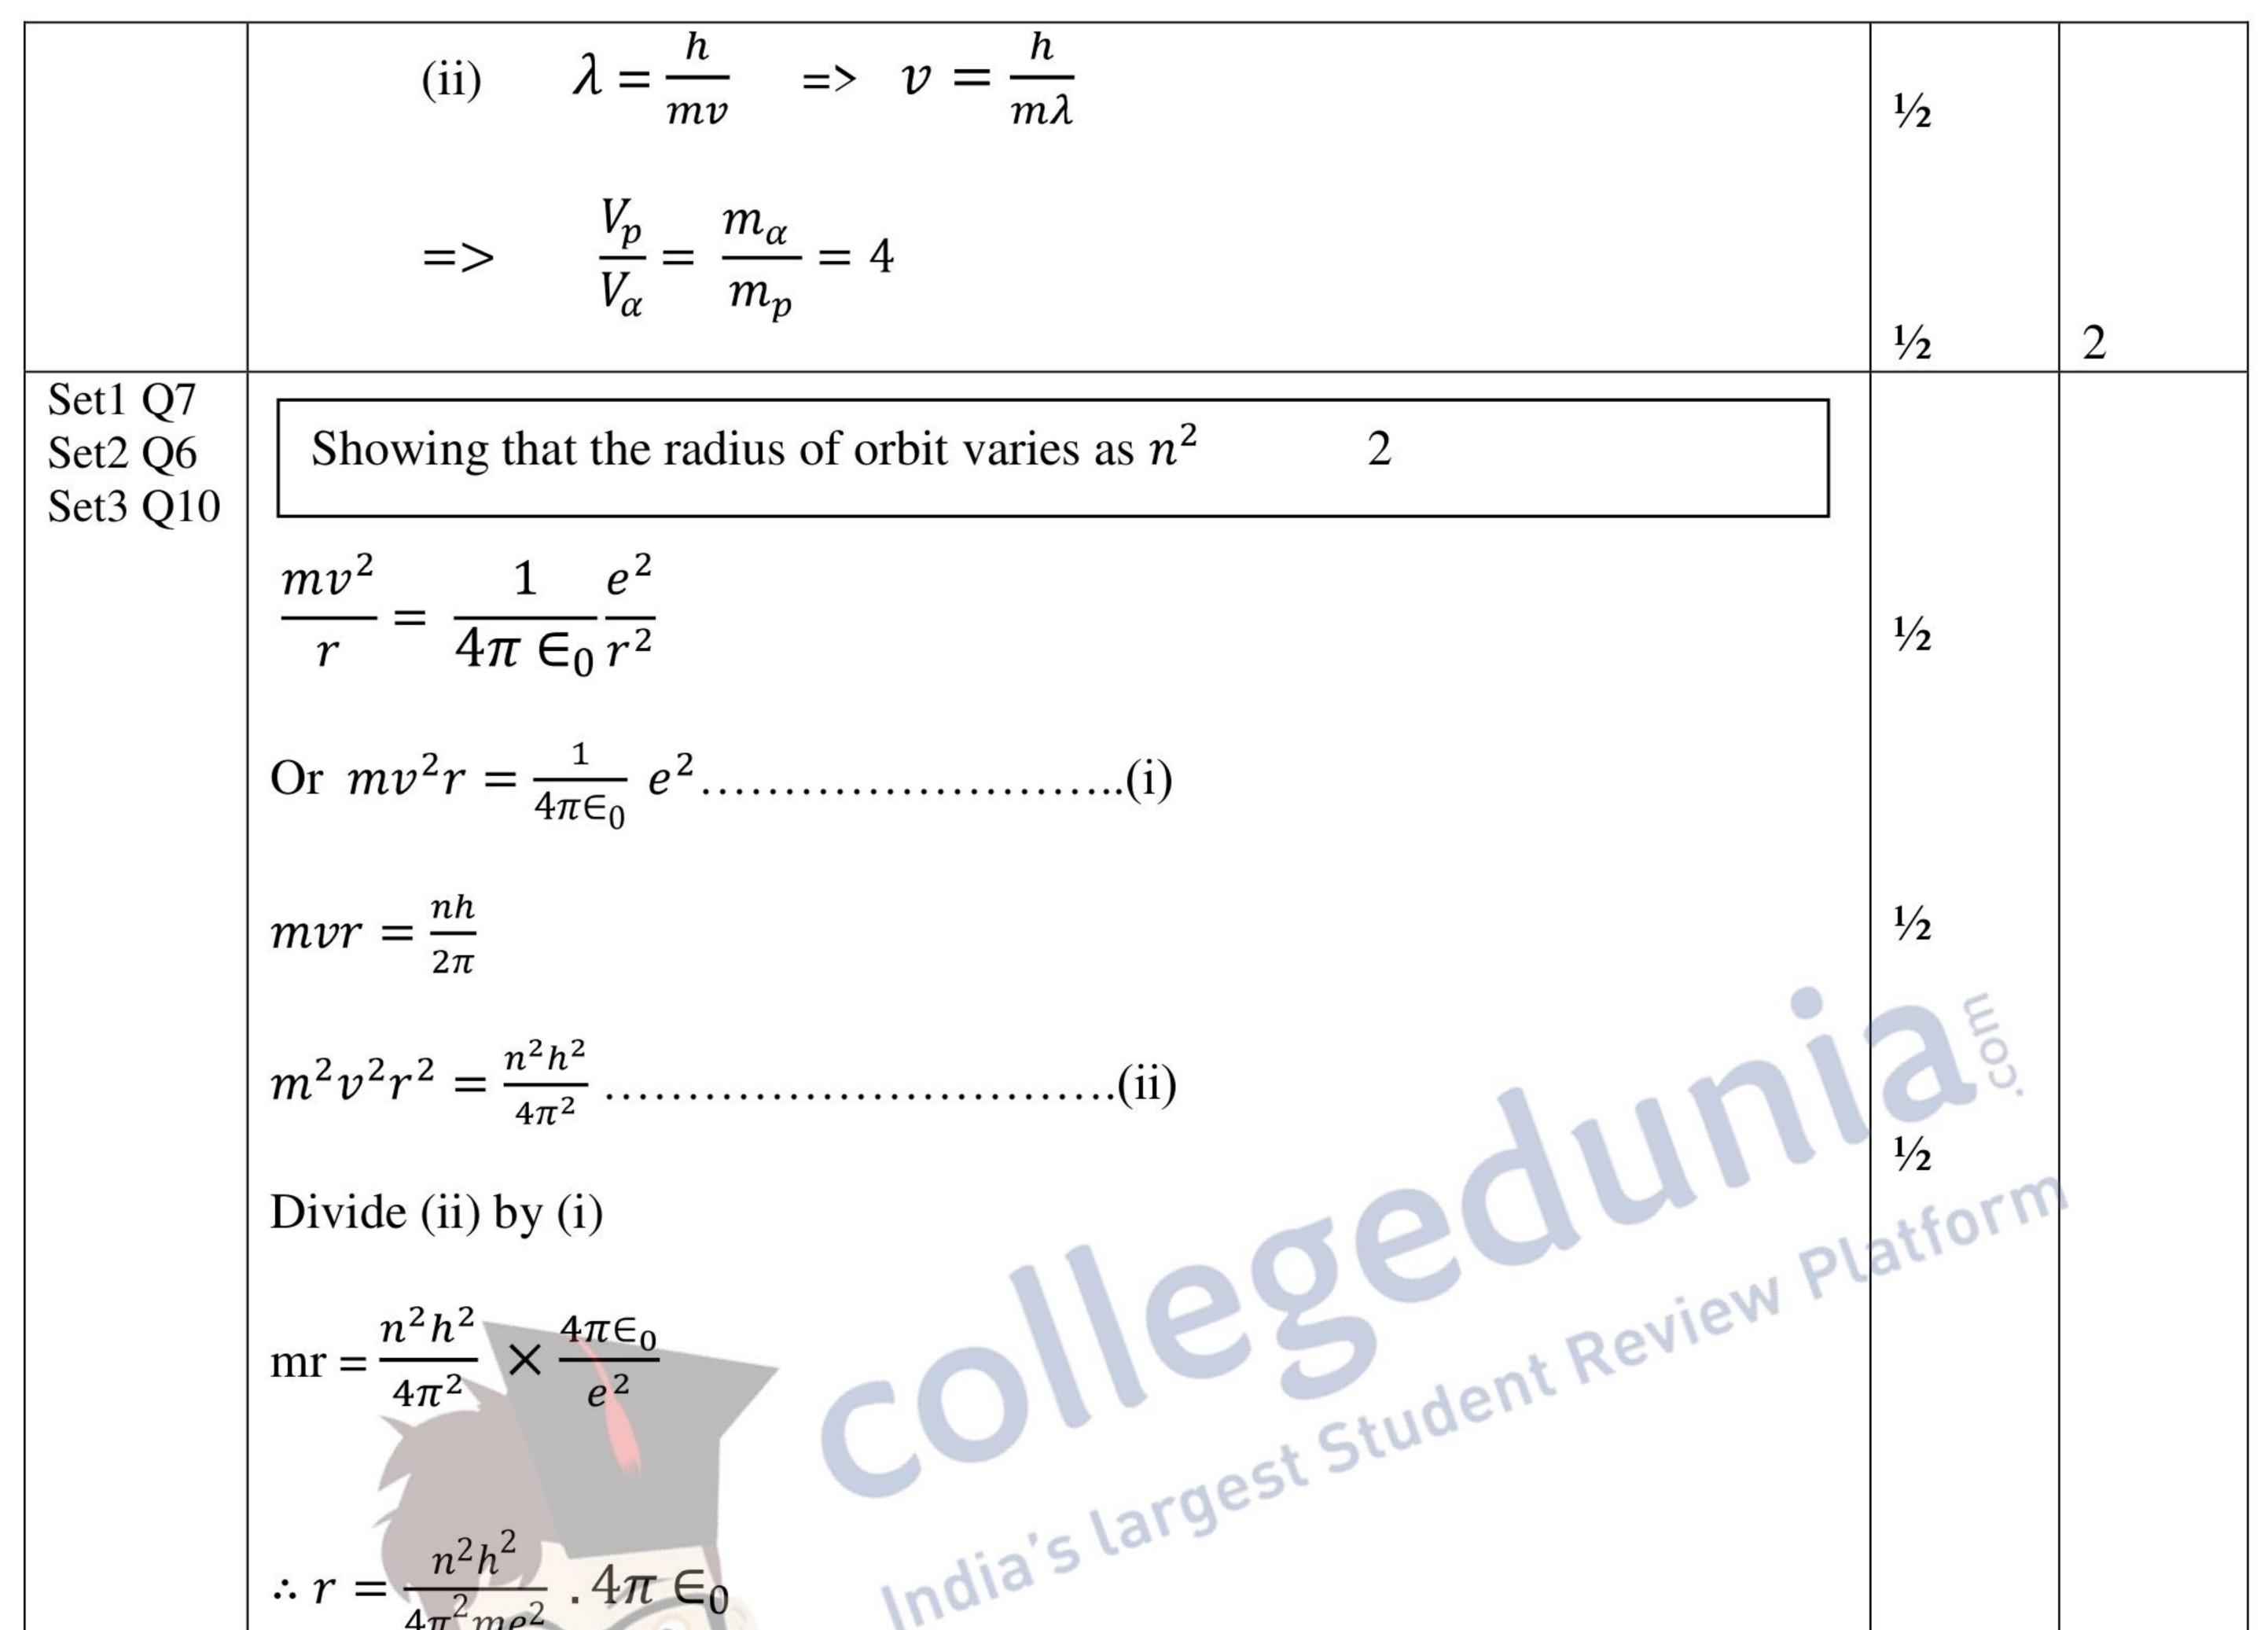

SET 55/1/1/D

MARKING SCHEME

Q. No.	Expected Answer / Value Points	Marks	Total Marks
Set1 Q1 Set2 Q5 Set3 Q4	It is defined as the opposition to the flow of current in ac circuits offered by a capacitor. Alternatively:		
	$X_{c} = \frac{1}{\omega C}$	1/2	
	S.I Unit : ohm	1⁄2	1
Set1 Q2 Set2 Q1 Set3 Q5	Zero	1	1
Set1 Q3 Set2 Q2 Set3 Q1	Converging (Convex Lens),(Also accept if a student writes it as a diverging Lens or Concave lens (Since hindi translation does not match with English version)		1
Set1 Q4 Set2 Q3 Set3 Q2	Side bands are produced due to the superposition of carrier waves of frequency ω_c over modulating / audio signal of frequency ω_m . <u>Alternatively:</u>	atforn	
0.1.05	(Credit may be given if a student mentions the side bands as $\omega_c \pm \omega_m$)	1/	1
Set1 Q5 Set2 Q4 Set3 Q3	DE : Negative resistance region AB : Where Ohm's law is obeyed.(Also accept BC)	1/2 1/2	1
Set1 Q6 Set2 Q10 Set3 Q9	Determination of ratio (i) accelerating potential 1 (ii) speed 1 (i) $\lambda = \frac{h}{\sqrt{2mqV}} \Rightarrow V = \frac{h^2}{2mq\lambda^2}$	1/2	
	$m_{\alpha} = 4m_{p} , q_{\alpha} = 2q_{p}$ $= \sum \frac{V_{p}}{V_{p}} = \frac{m_{\alpha} q_{\alpha}}{V_{p}}$		
	$V_{\alpha} \qquad m_p q_p$ $= \frac{4m_p \times 2 q_p}{4m_p \times 2 q_p}$		

	$\therefore r = \frac{n^2 n}{4\pi^2 m e^2} \cdot 4\pi \in 0$ India		1⁄2		
	$\therefore r \propto n^2$			2	
	(Give full credit to any other correct al	ternative method)			
Set1 Q8 Set2 Q7 Set3 Q6	Distinction between intrinsic & extrin	sic semiconductor 2			6
	Intrinsic Semiconductor	Extrinsic Semiconductor			
	(i) Without any impurity atoms.	(i) Doped with trivalent/ pentavalent impurity atoms.	1		
	$\left \begin{array}{cc} (\text{ii}) & n_e = n_h \end{array} \right $	(ii) $n_e \neq n_h$	1		
	(Any other correct distinguishing featu	res.)		2

Let the rotating Polaroid sh	ant mailen an anala O with the f	ingt Dalamaid	
\therefore angle with the other Pola	teet makes an angle θ with the first field will be (90 - θ)	irst Polarold	1⁄2

Applying Kirchoff's loop rule to closed loop ADBA

$$-I_1R_1 + 0 + I_2R_2 = 0 (I_g = 0)$$

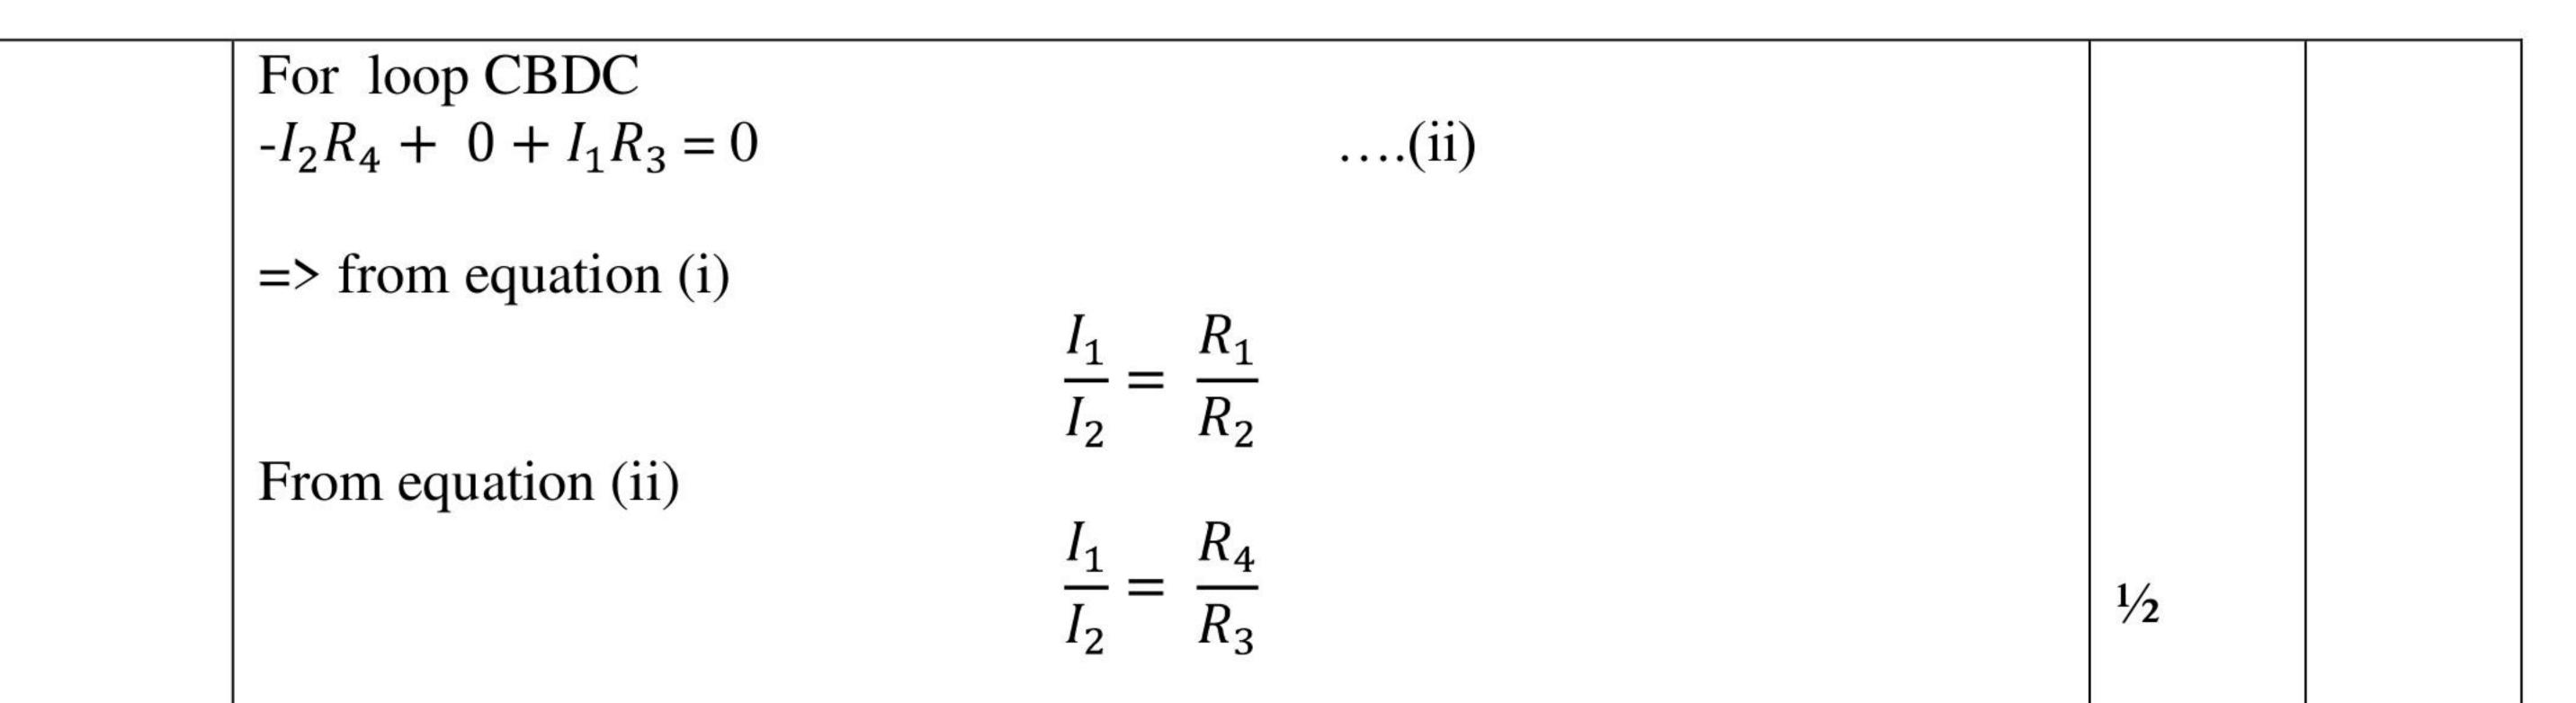

(i)

Page 4 of 23

	$\therefore \frac{R_1}{R_2} = \frac{R_4}{R_3}$	1⁄2	2
Set1 Q11 Set2 Q19	Name of the parts of e.m. spectrum for a,b,c $\frac{1}{2} + \frac{1}{2} + \frac{1}{2}$		
Set3 Q16	Production $\frac{1}{2} + \frac{1}{2} + \frac{1}{2}$		
	(a) Microwave Production : Klystron/magnetron/Gunn diode (any one)	$\frac{1}{2}$ $\frac{1}{2}$ $\frac{1}{2}$	
	(b) Infrared Radiation		
	Production : Hot bodies / vibrations of atoms and molecules (any one)	1/2	
	(c) X-Rays	1/2	
	Production : Bombarding high energy electrons on metal target/ x-ray	1/2	3
	tube/inner shell electrons(any one).		
Set1 Q12			
Set2 Q20 Set3 Q17	(i) Calculation of angular magnification $1\frac{1}{2}$		
	(ii) Calculation of image of diameter of Moon 1 ¹ / ₂		
	Angular Magnification		
	$m = \frac{f_o}{f_e}$	1	
	$=\frac{15}{10^{-2}}=1500$	1⁄2	

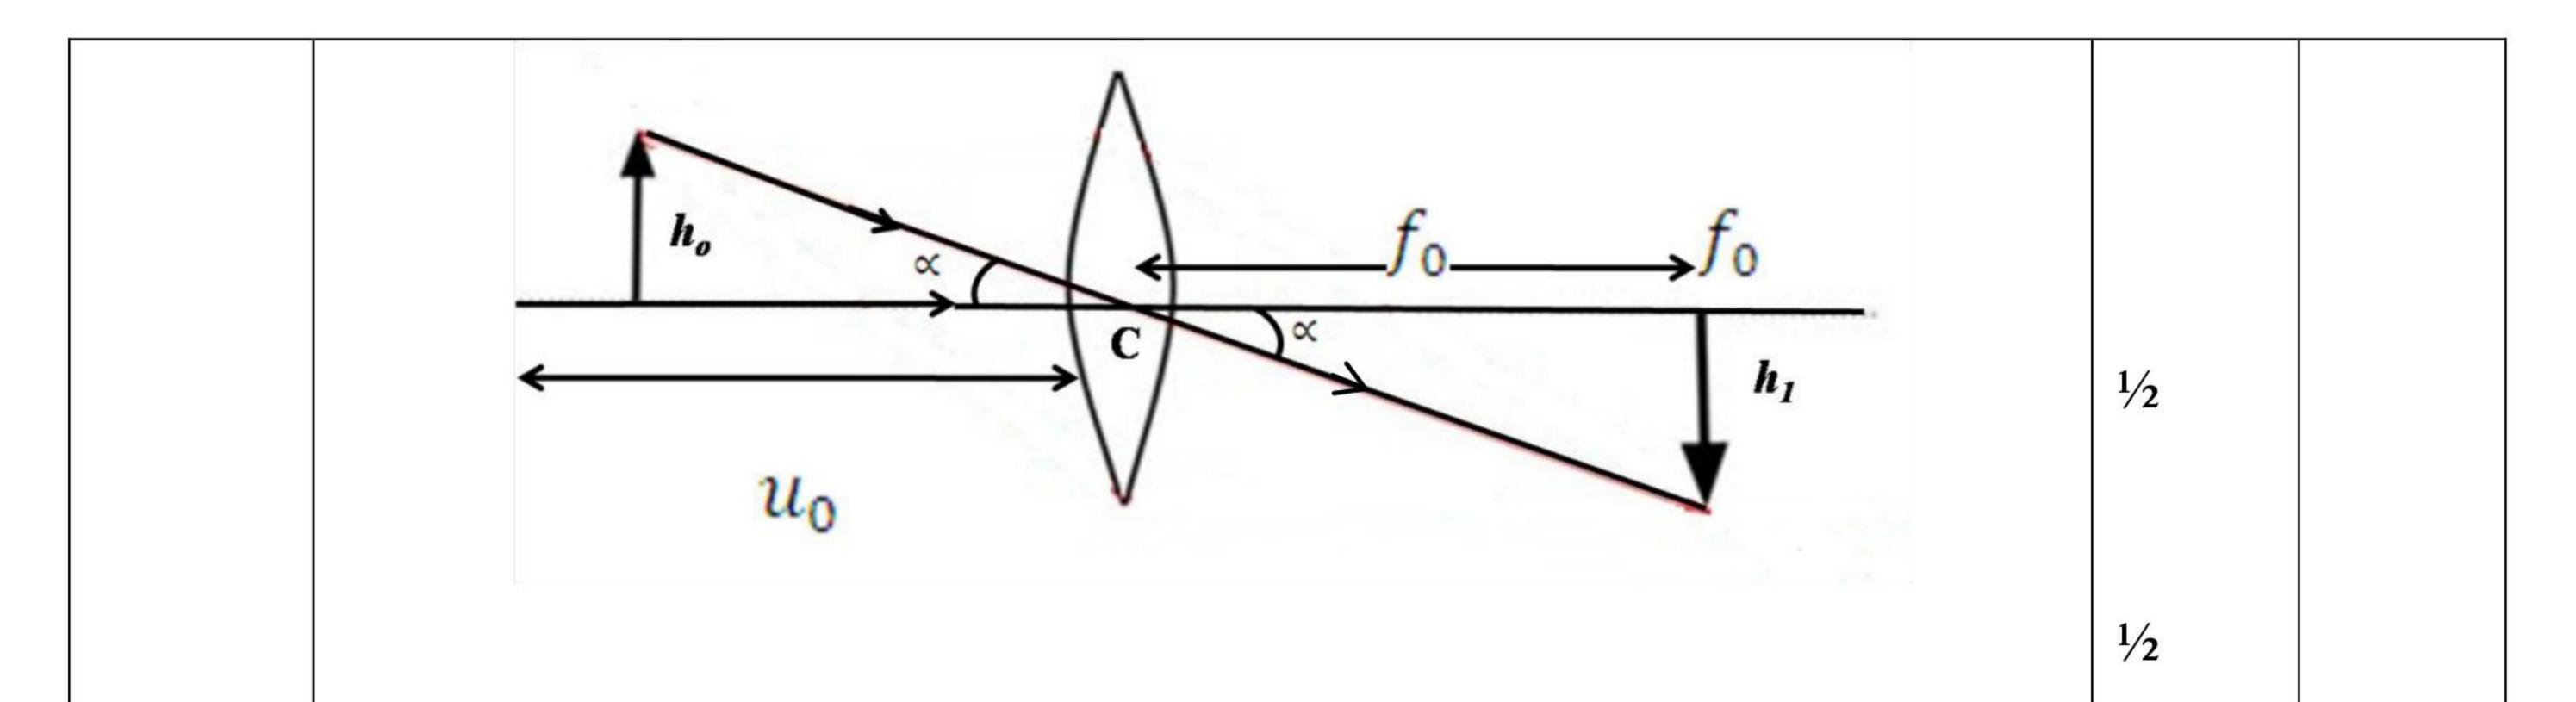

Page 5 of 23

17/03/15 4:30 p.m.

	Angular size of the moon = $\left(\frac{3.48 \times 10^6}{3.8 \times 10^8}\right) = \frac{3.48}{3.8} \times 10^{-2}$ radian \therefore Angular size of the image = $\left(\frac{3.48}{3.8} \times 10^{-2} \times 1500\right)$ = radian	1/2	3	
	Diameter of the image = $\frac{3.48}{3.8} \times 15 \times focal length of eye piece$ = $\frac{3.48}{3.8} \times 15 \times 1cm$ =13.7cm (Also accept alternative correct method.)	a.e.		
Set1 Q13 Set2 Q23 Set3 Q13	(i) Einstein's Photoelectric equation $\frac{1}{2}$	ation 1/2		

 $\Psi o + \Psi max$ or $hv = hv_0 + \frac{1}{2}mv_{max}^2$

Important features

(i) k_{max} depends linearly on frequency $v_{.}$ (ii) Existence of threshold frequency for the metal surface. (Any other two correct features.)

$$hv = \varphi_{0+}k_{max}$$

$$\frac{hc}{\lambda_{1}} = \frac{hc}{\lambda_{0}} k_{max} \qquad -----(i)$$

$$\frac{hc}{\lambda_{2}} = \frac{hc}{\lambda_{0}} 2k_{max} \qquad -----(i)$$
From (i) and (ii)

1/2 1/2 1/2 $1/_{2}$

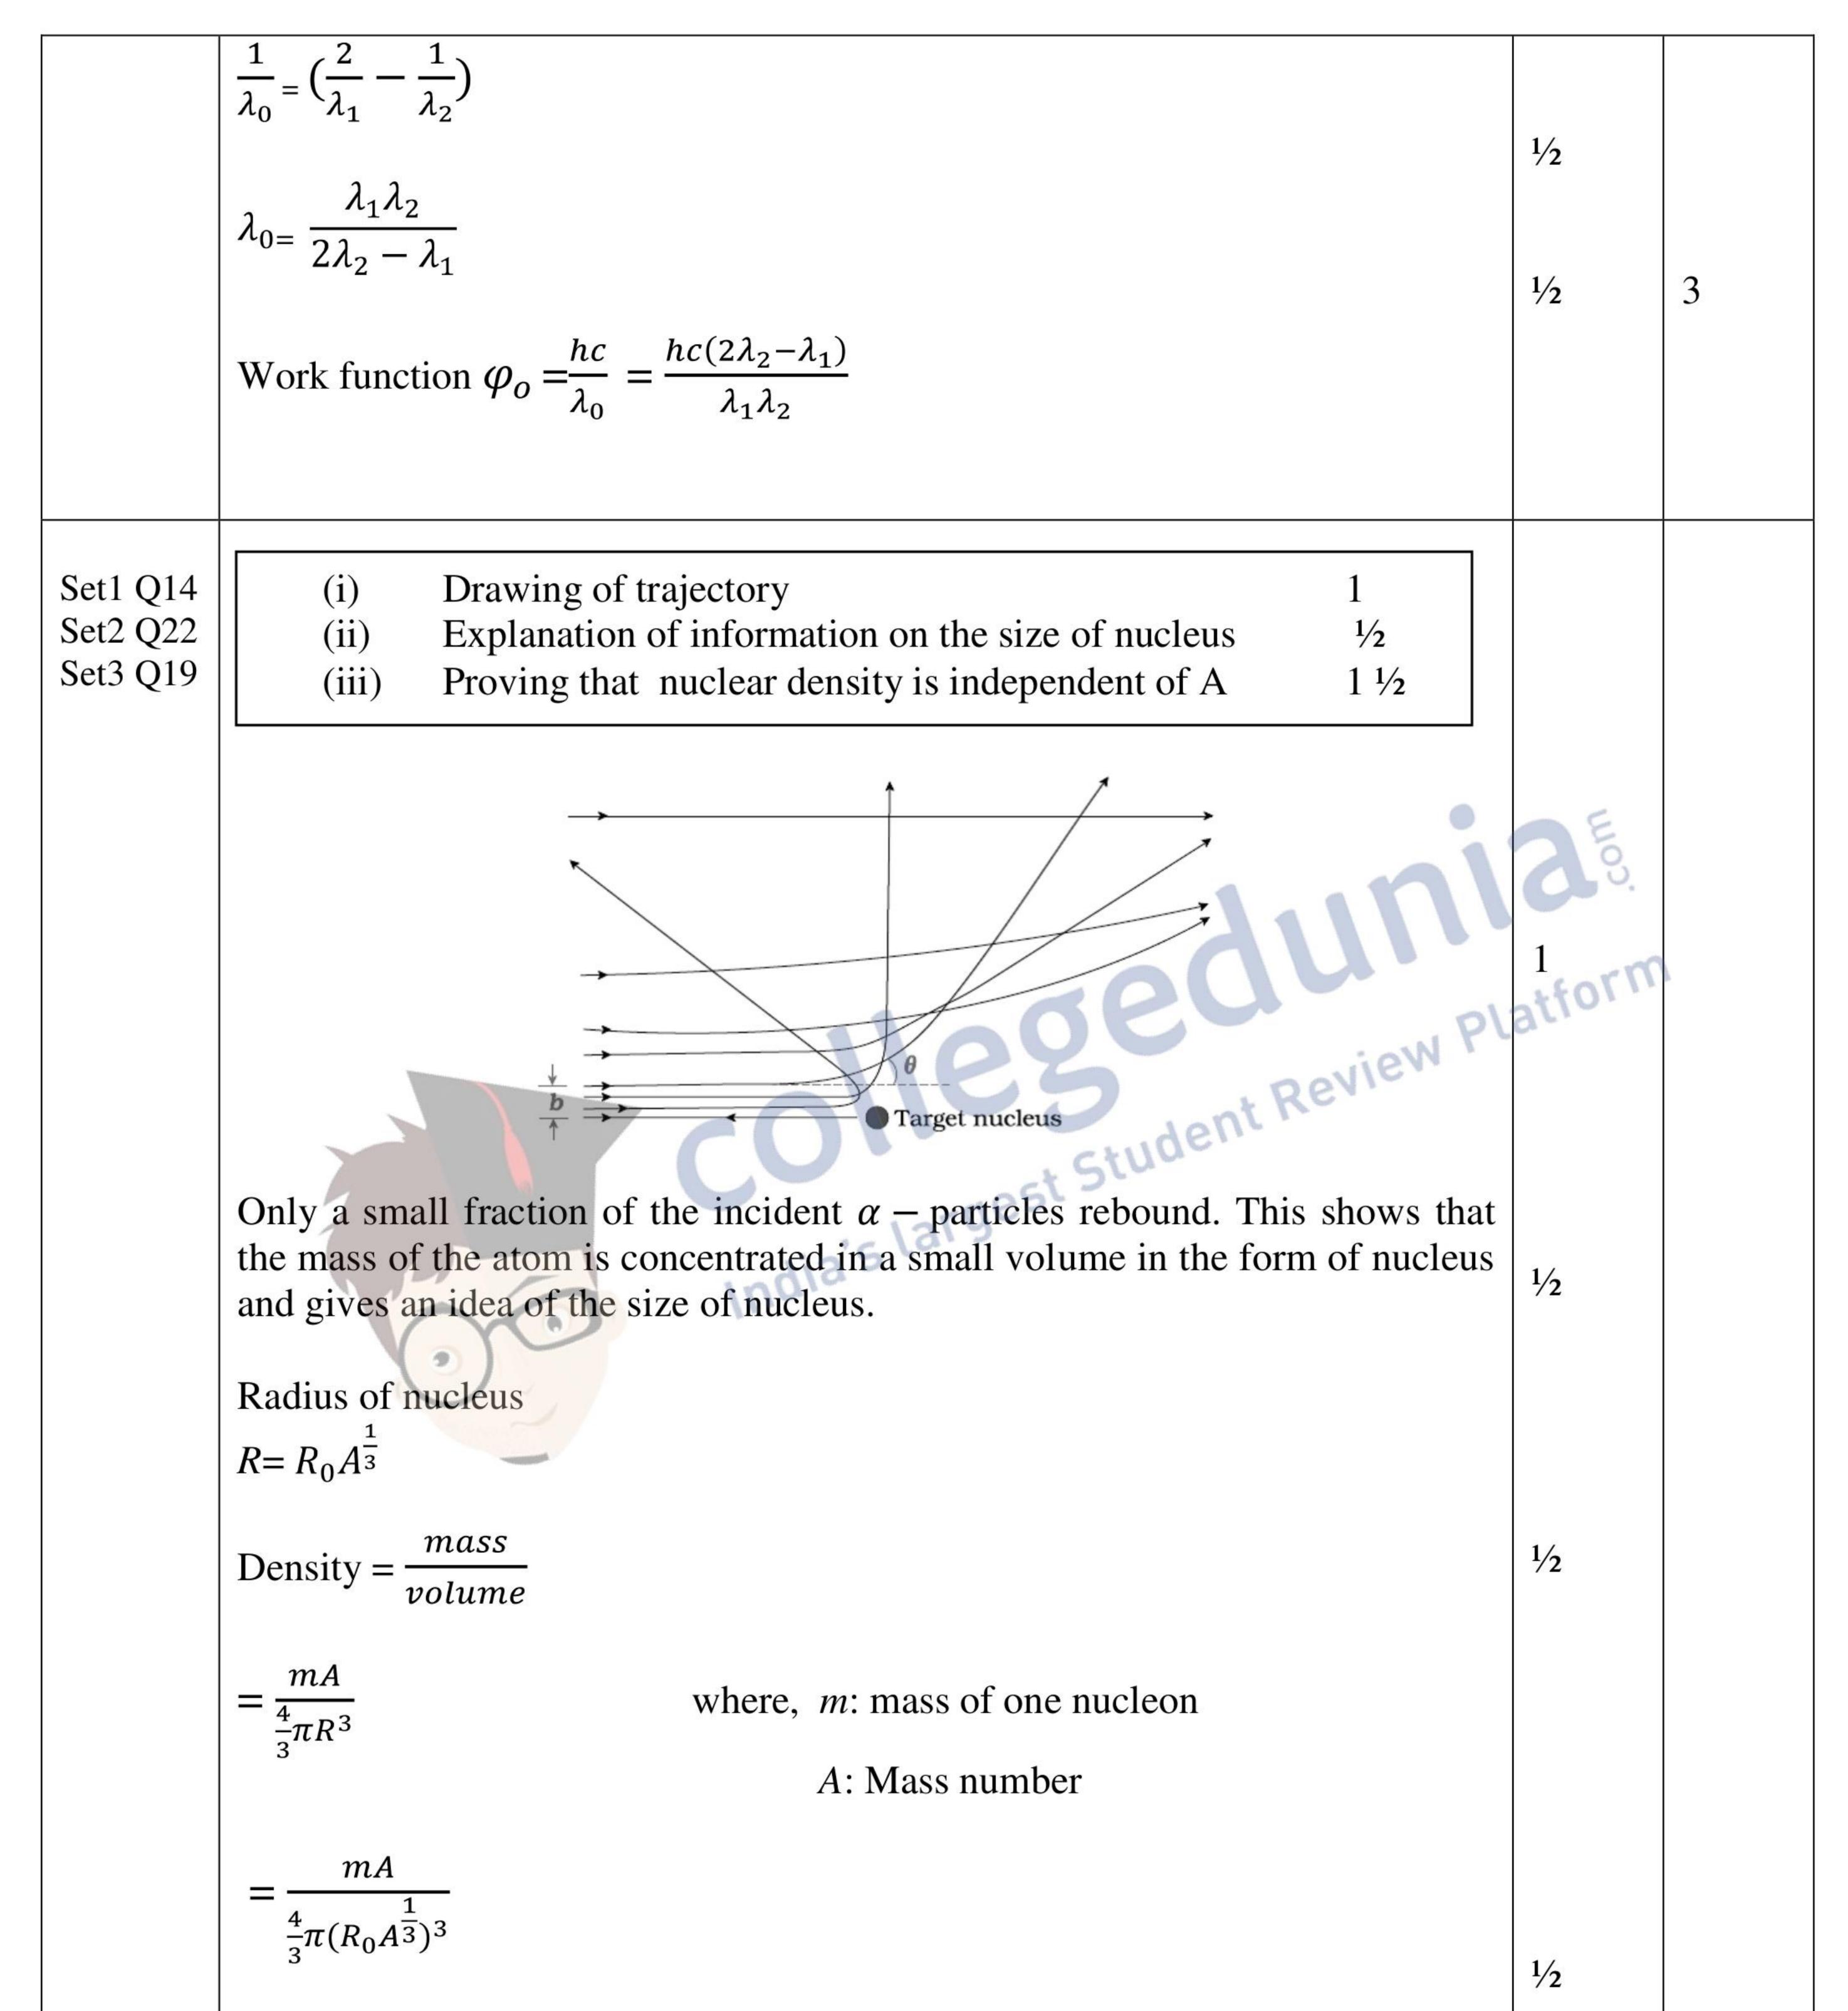

$$\frac{2hc}{\lambda_1} - \frac{hc}{\lambda_2} = \frac{hc}{\lambda_0}$$

Final Draft

17/03/15 4:30 p.m.

Distinction between nuclear fission and nuclear fusion	$\frac{1}{2} + \frac{1}{2}$	
Showing release of energy in both processes	1/2	
Calculation of release of energy	1 1/2	

Binding energy per nucleon, of the daughter nuclei, in both processes, is more than that of the parent nuclei. The difference in binding energy is released in the form of energy. In both processes some mass gets converted into energy.

Alternativey:

In both processes, some mass gets converted into energy.

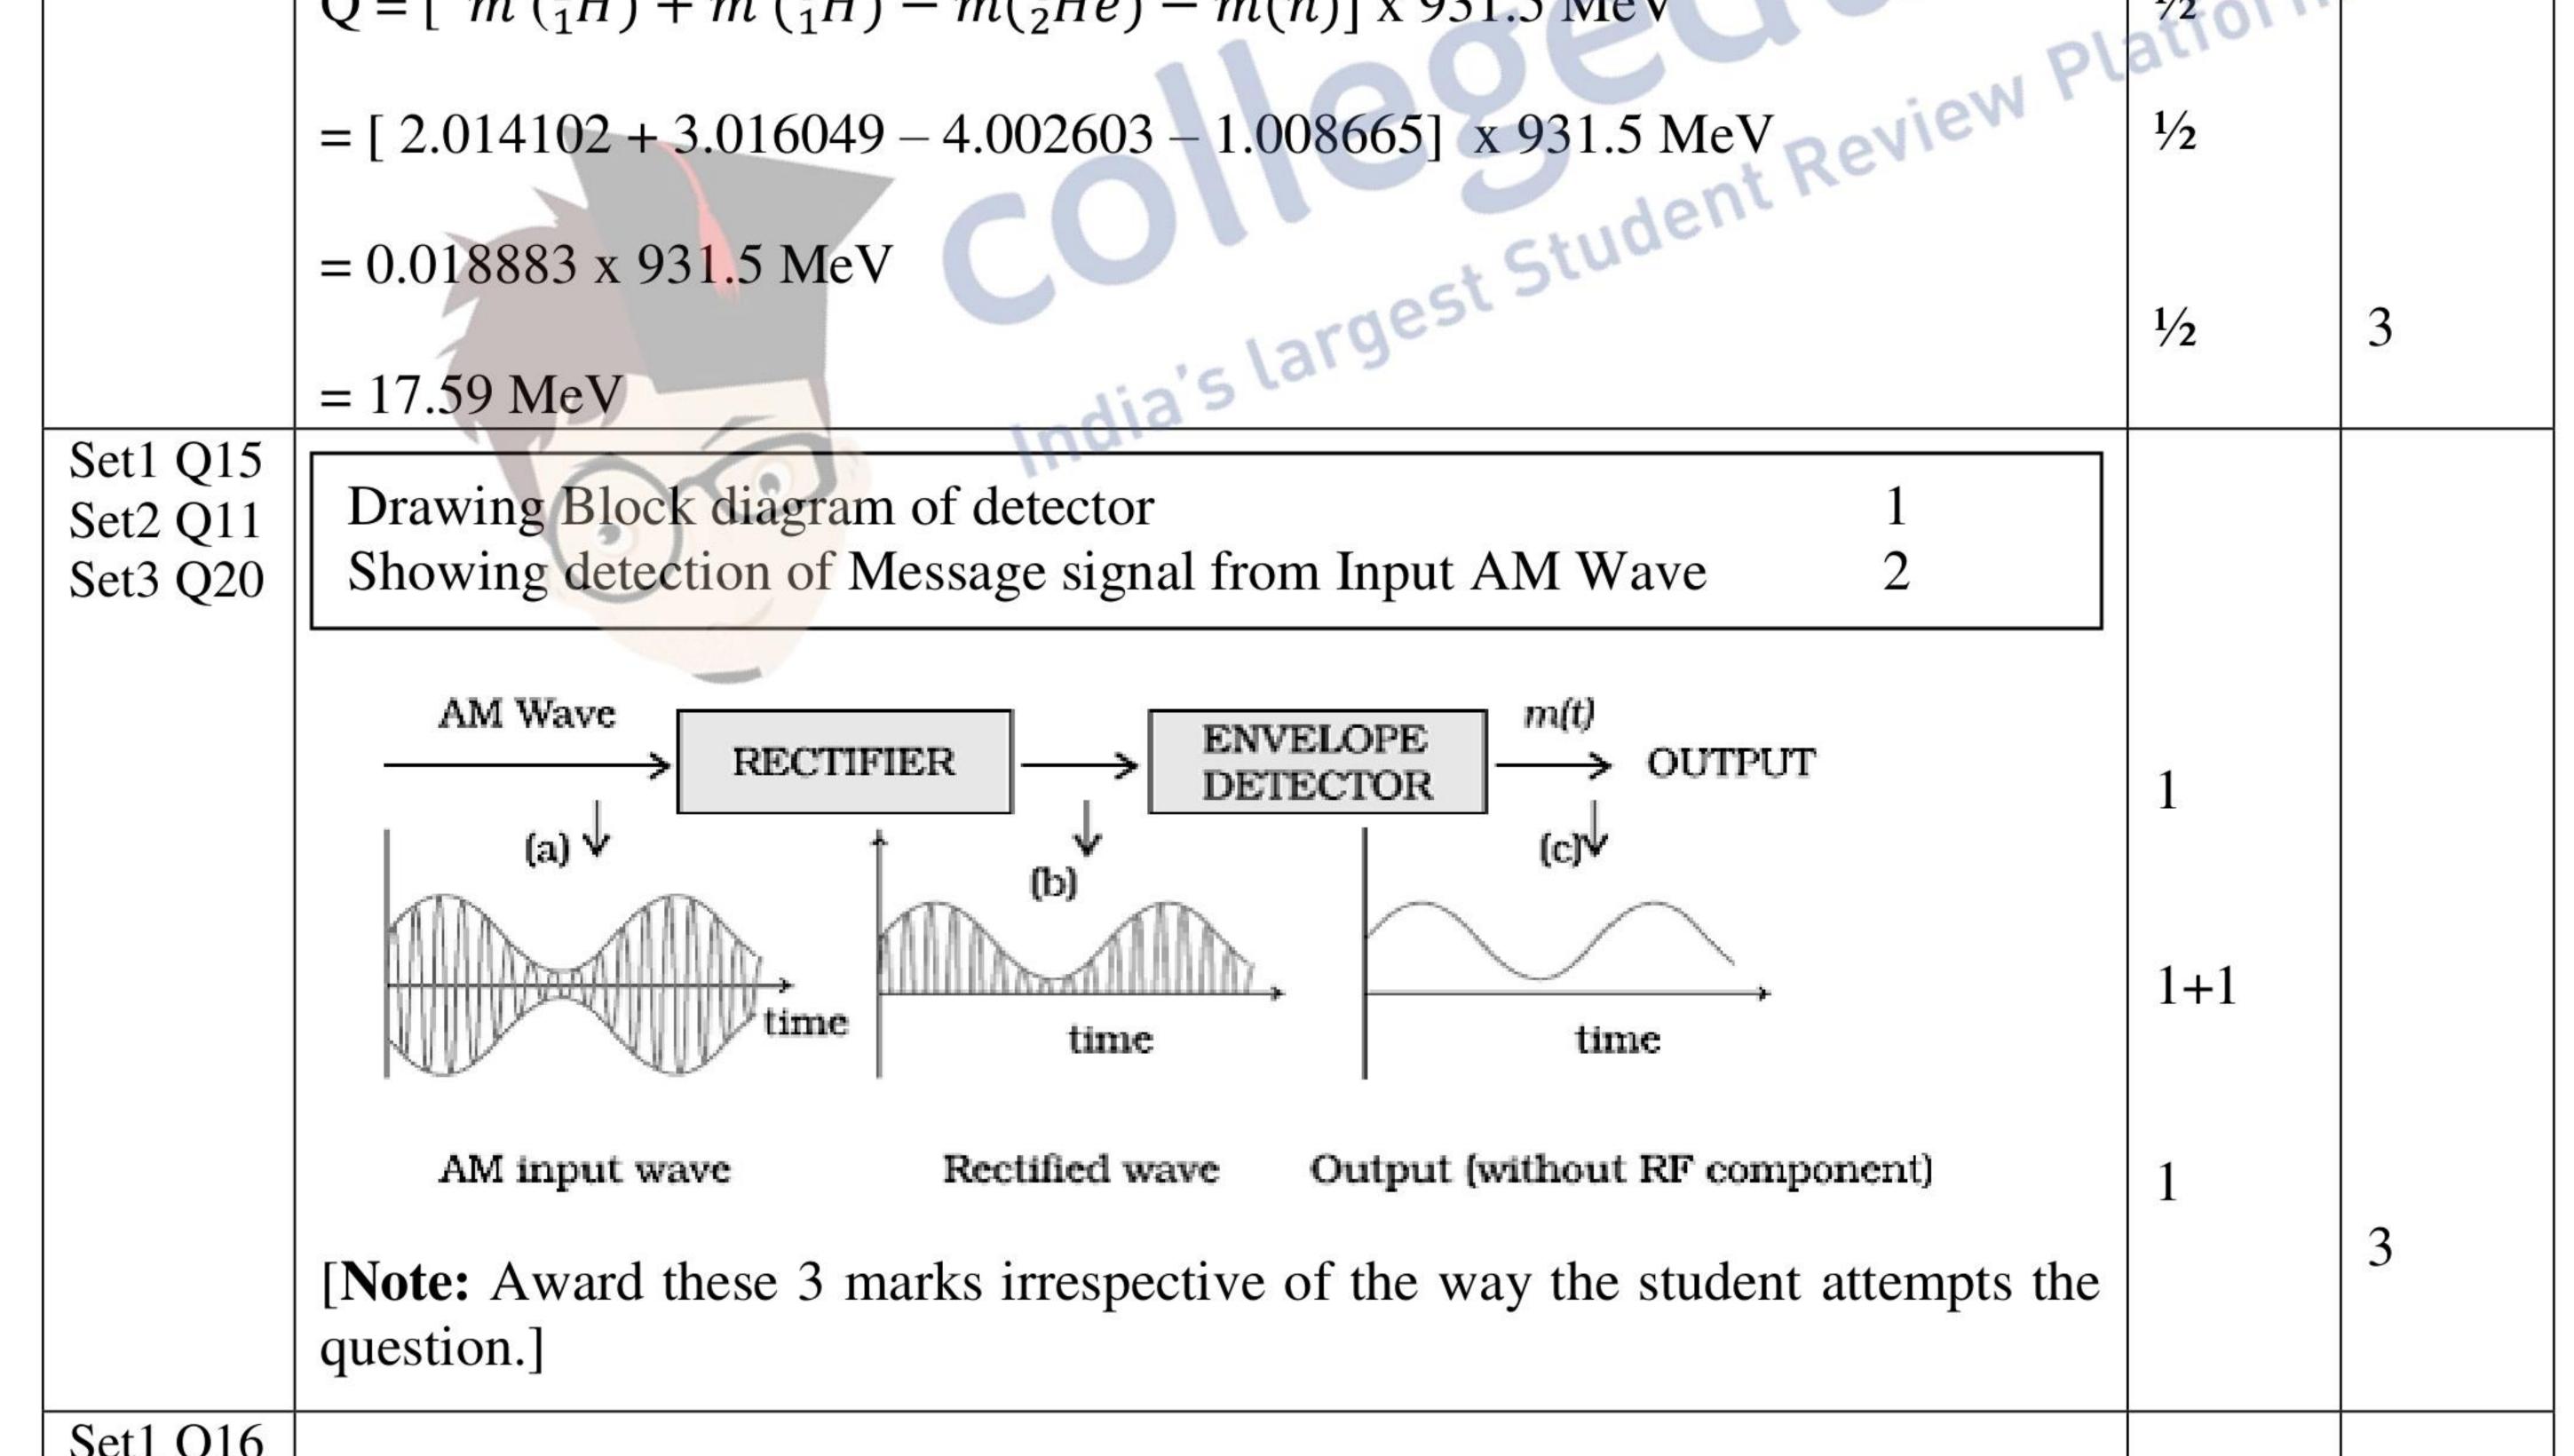

Energy Released

Q = $[m(_1^2H) + m(_1^3H) - m(_2^4He) - m(n)] \ge 931.5 \text{ MeV}$

Set1 Q17 Set2 Q13	Determination of C_1 and C_2 2	
Set2 Q15 Set3 Q22	Determination of C1 and C2 Determination of Charge on each capacitor in parallel combination $\frac{1}{2} + \frac{1}{2}$	

Page 9 of 23

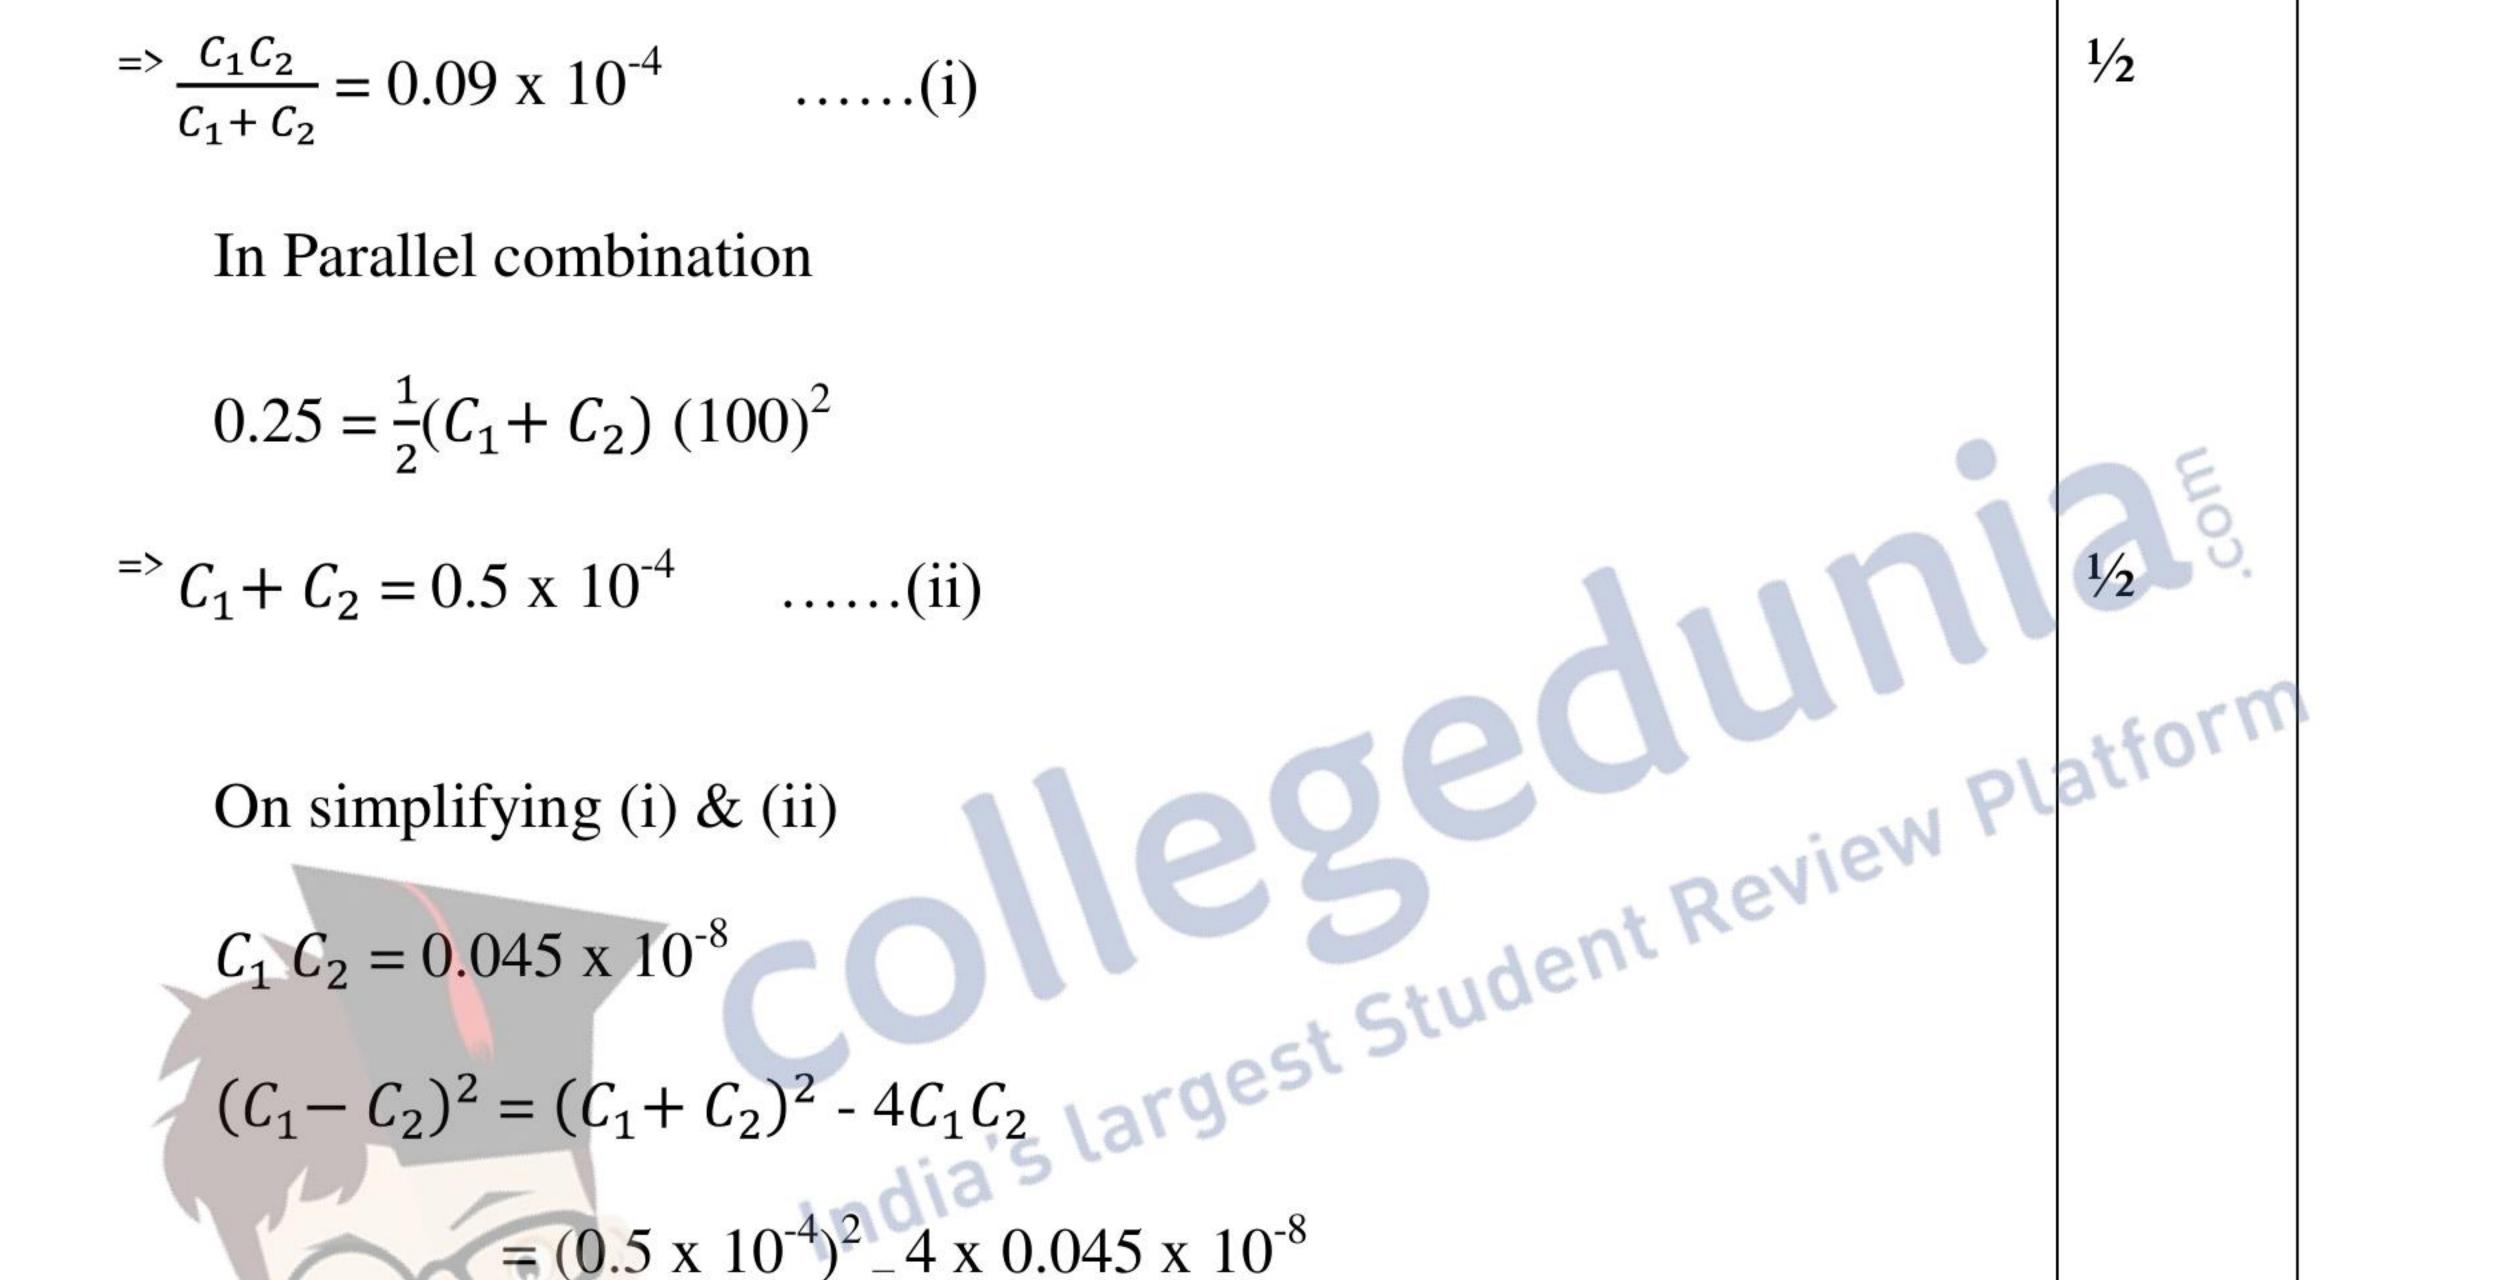

17/03/15 4:30 p.m.

Energy stored in a capacitor

$$E = \frac{1}{2}CV^{2}$$
In series combination

$$0.045 = \frac{1}{2}\frac{C_{1}C_{2}}{C_{1}+C_{2}}(100)^{2}$$

$$= (0.5 \times 10^{-4})^2 - 4 \times 0.045 \times 10^{-8}$$
$$= 0.25 \times 10^{-8} - 0.180 \times 10^{-8}$$
$$(C_1 - C_2)^2 = 0.07 \times 10^{-8}$$

$$(C_1 - C_2) = 2.6 \times 10^{-5} = 0.26 \times 10^{-4} \dots$$
 (iii)

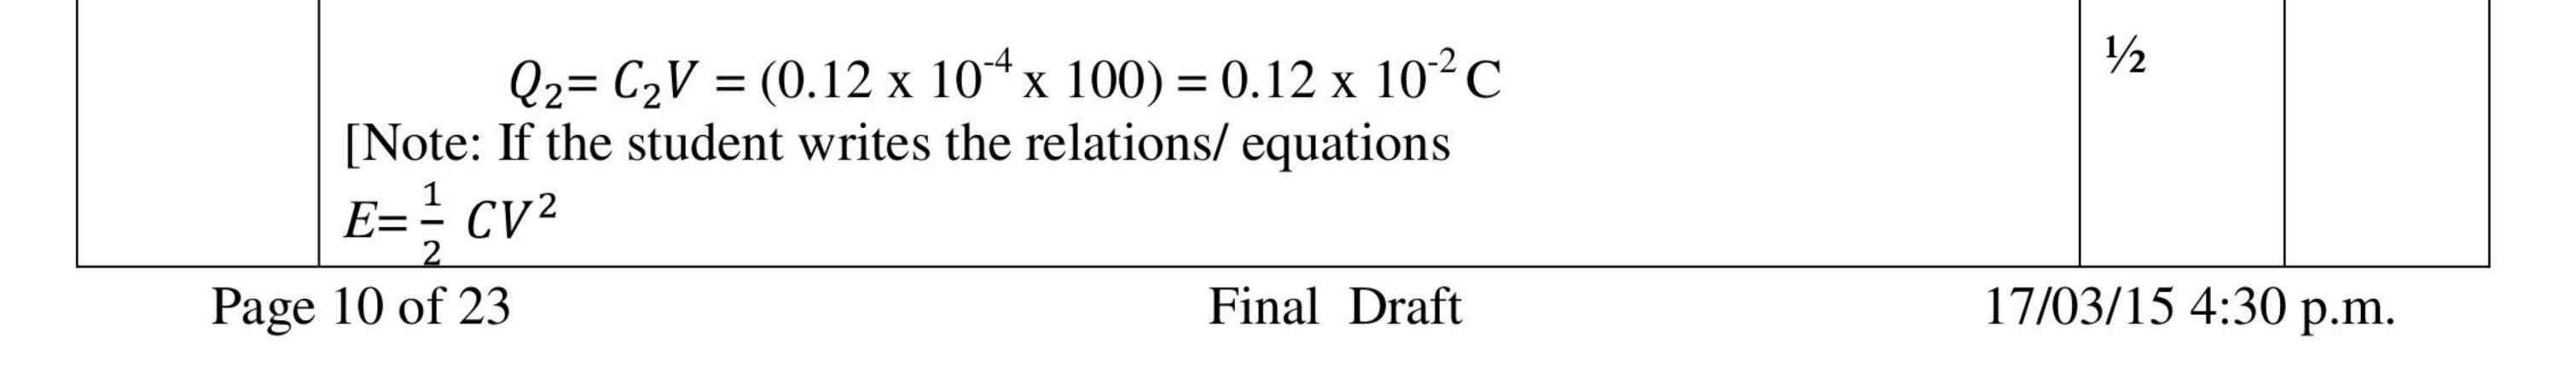

From (ii) and (iii) we have

 $\Rightarrow C_1 = 0.38 \text{ x } 10^{-4} \text{ F } \& C_2 = 0.12 \text{ x } 10^{-4} \text{ F}$

Charges on capacitor C_1 and C_2 in Parallel combination

$$Q_1 = C_1 V = (0.38 \text{ x } 10^{-4} \text{ x } 100) = 0.38 \text{ x } 10^{-2} \text{ C}$$

 $\frac{1}{2}$

And
$$0.045 = \frac{1}{2} \left(\frac{c_1 c_2}{c_1 + c_2} \right) (100)^2$$

 $0.25 = \frac{1}{2} (C_1 + C_2) (100)^2$
But is unable to calculate C_1 and C_2 , award him/her full 2 marks.
Also if the student just writes
 $Q_1 = C_1 V = C_1 (100)$ and $Q_2 = C_2 V = C_2 (100)$
Award him/her one mark for this part of the question.]
Working Principle

	Let R_3 be the resistance required for conversion into voltmeter of range 2V $\therefore 2V = I_g (G + R_3)$ Also $V = I_g (G + R_1)$ $\therefore 2 = \frac{G + R_3}{G + R_1}$	1/2		
	$\therefore R_3 = G + 2R_1 = R_1 - 2R_2 + 2R_1 = 3R_1 - 2R_2$	1/2	3	
Set1 Q19 Set2 Q15 Set3 Q12	Fabrication of photodiode1/2Working with suitable diagram1 1/2Reason1			
	It is fabricated with a transparent window to allow light to fall on diode.	1⁄2		
	When the photodiode is illuminated with photons of energy ($h\nu > E_g$) greater			

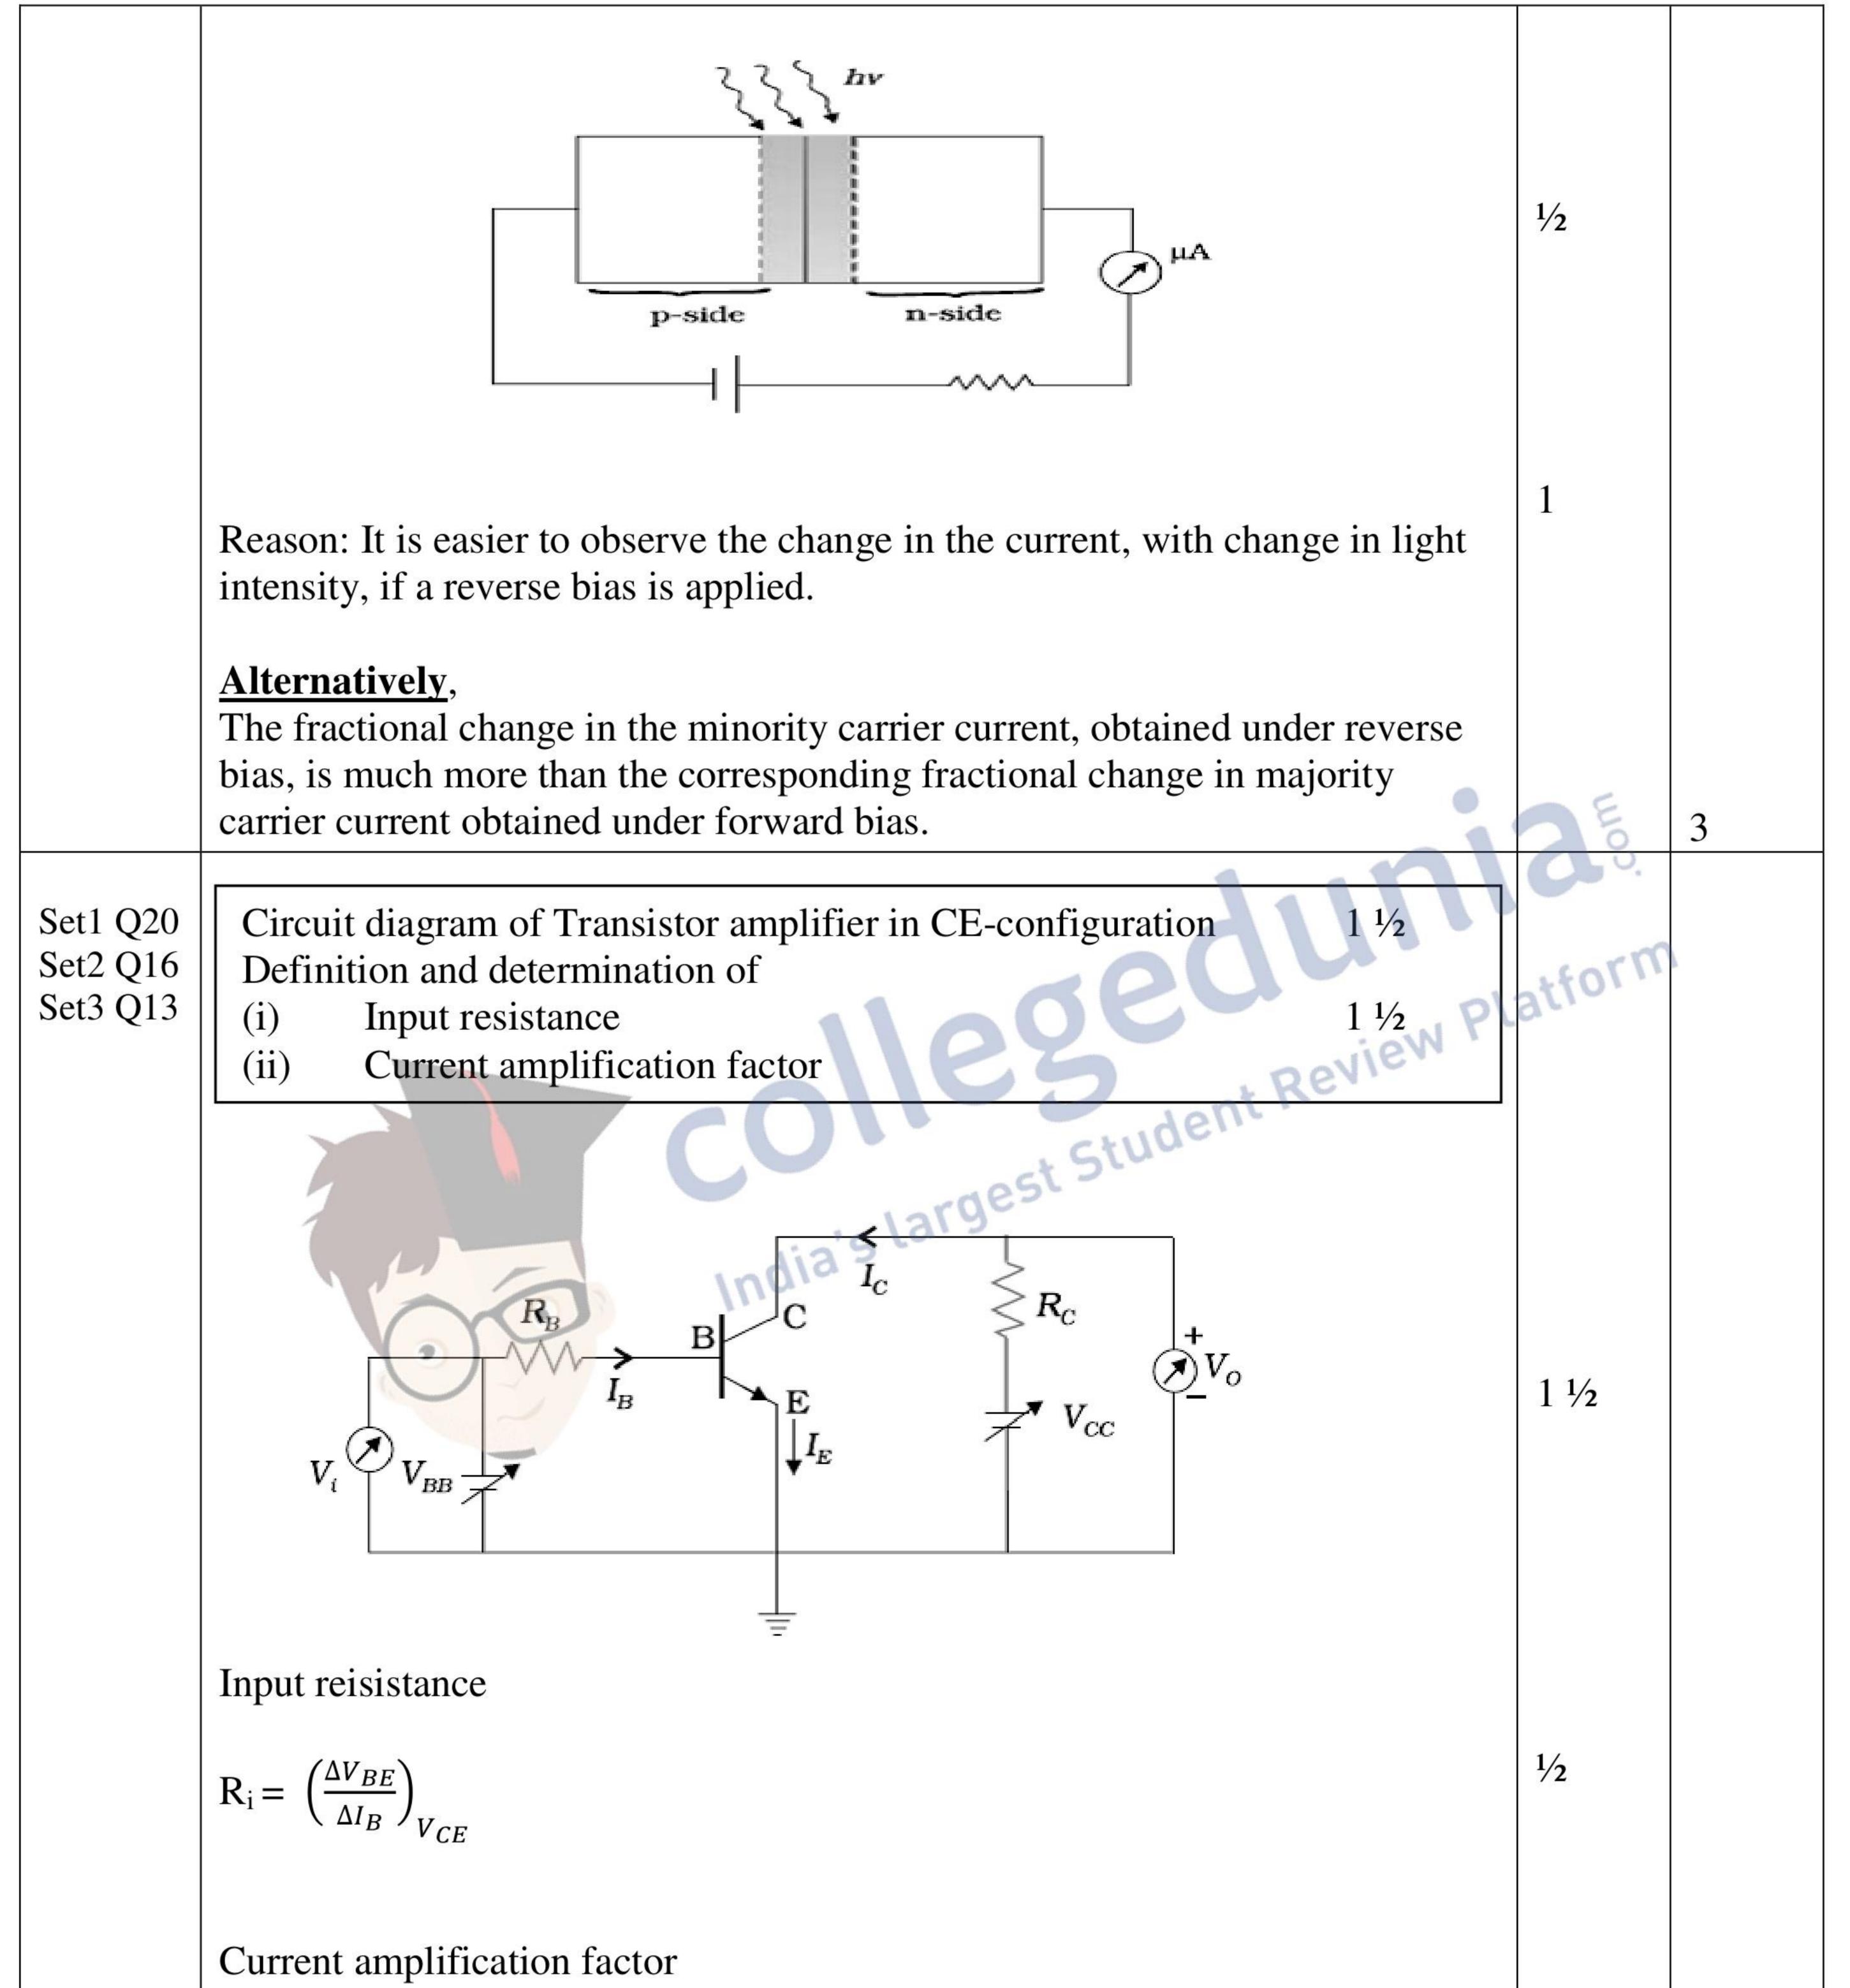

than the energy gap of the semiconductor, electron – holes pairs are generated. These gets separated due to the Junction electric field (before they recombine) which produces an emf. 1

$$\Rightarrow B \ge 2\pi r = \mu_0 n 2\pi rI$$

$$B = \mu_0 nI$$

$$\frac{1}{2}$$

Mutual inductance is equal to the induced emf set up in one coil when the rate of change of current flowing through the other coil is unity.

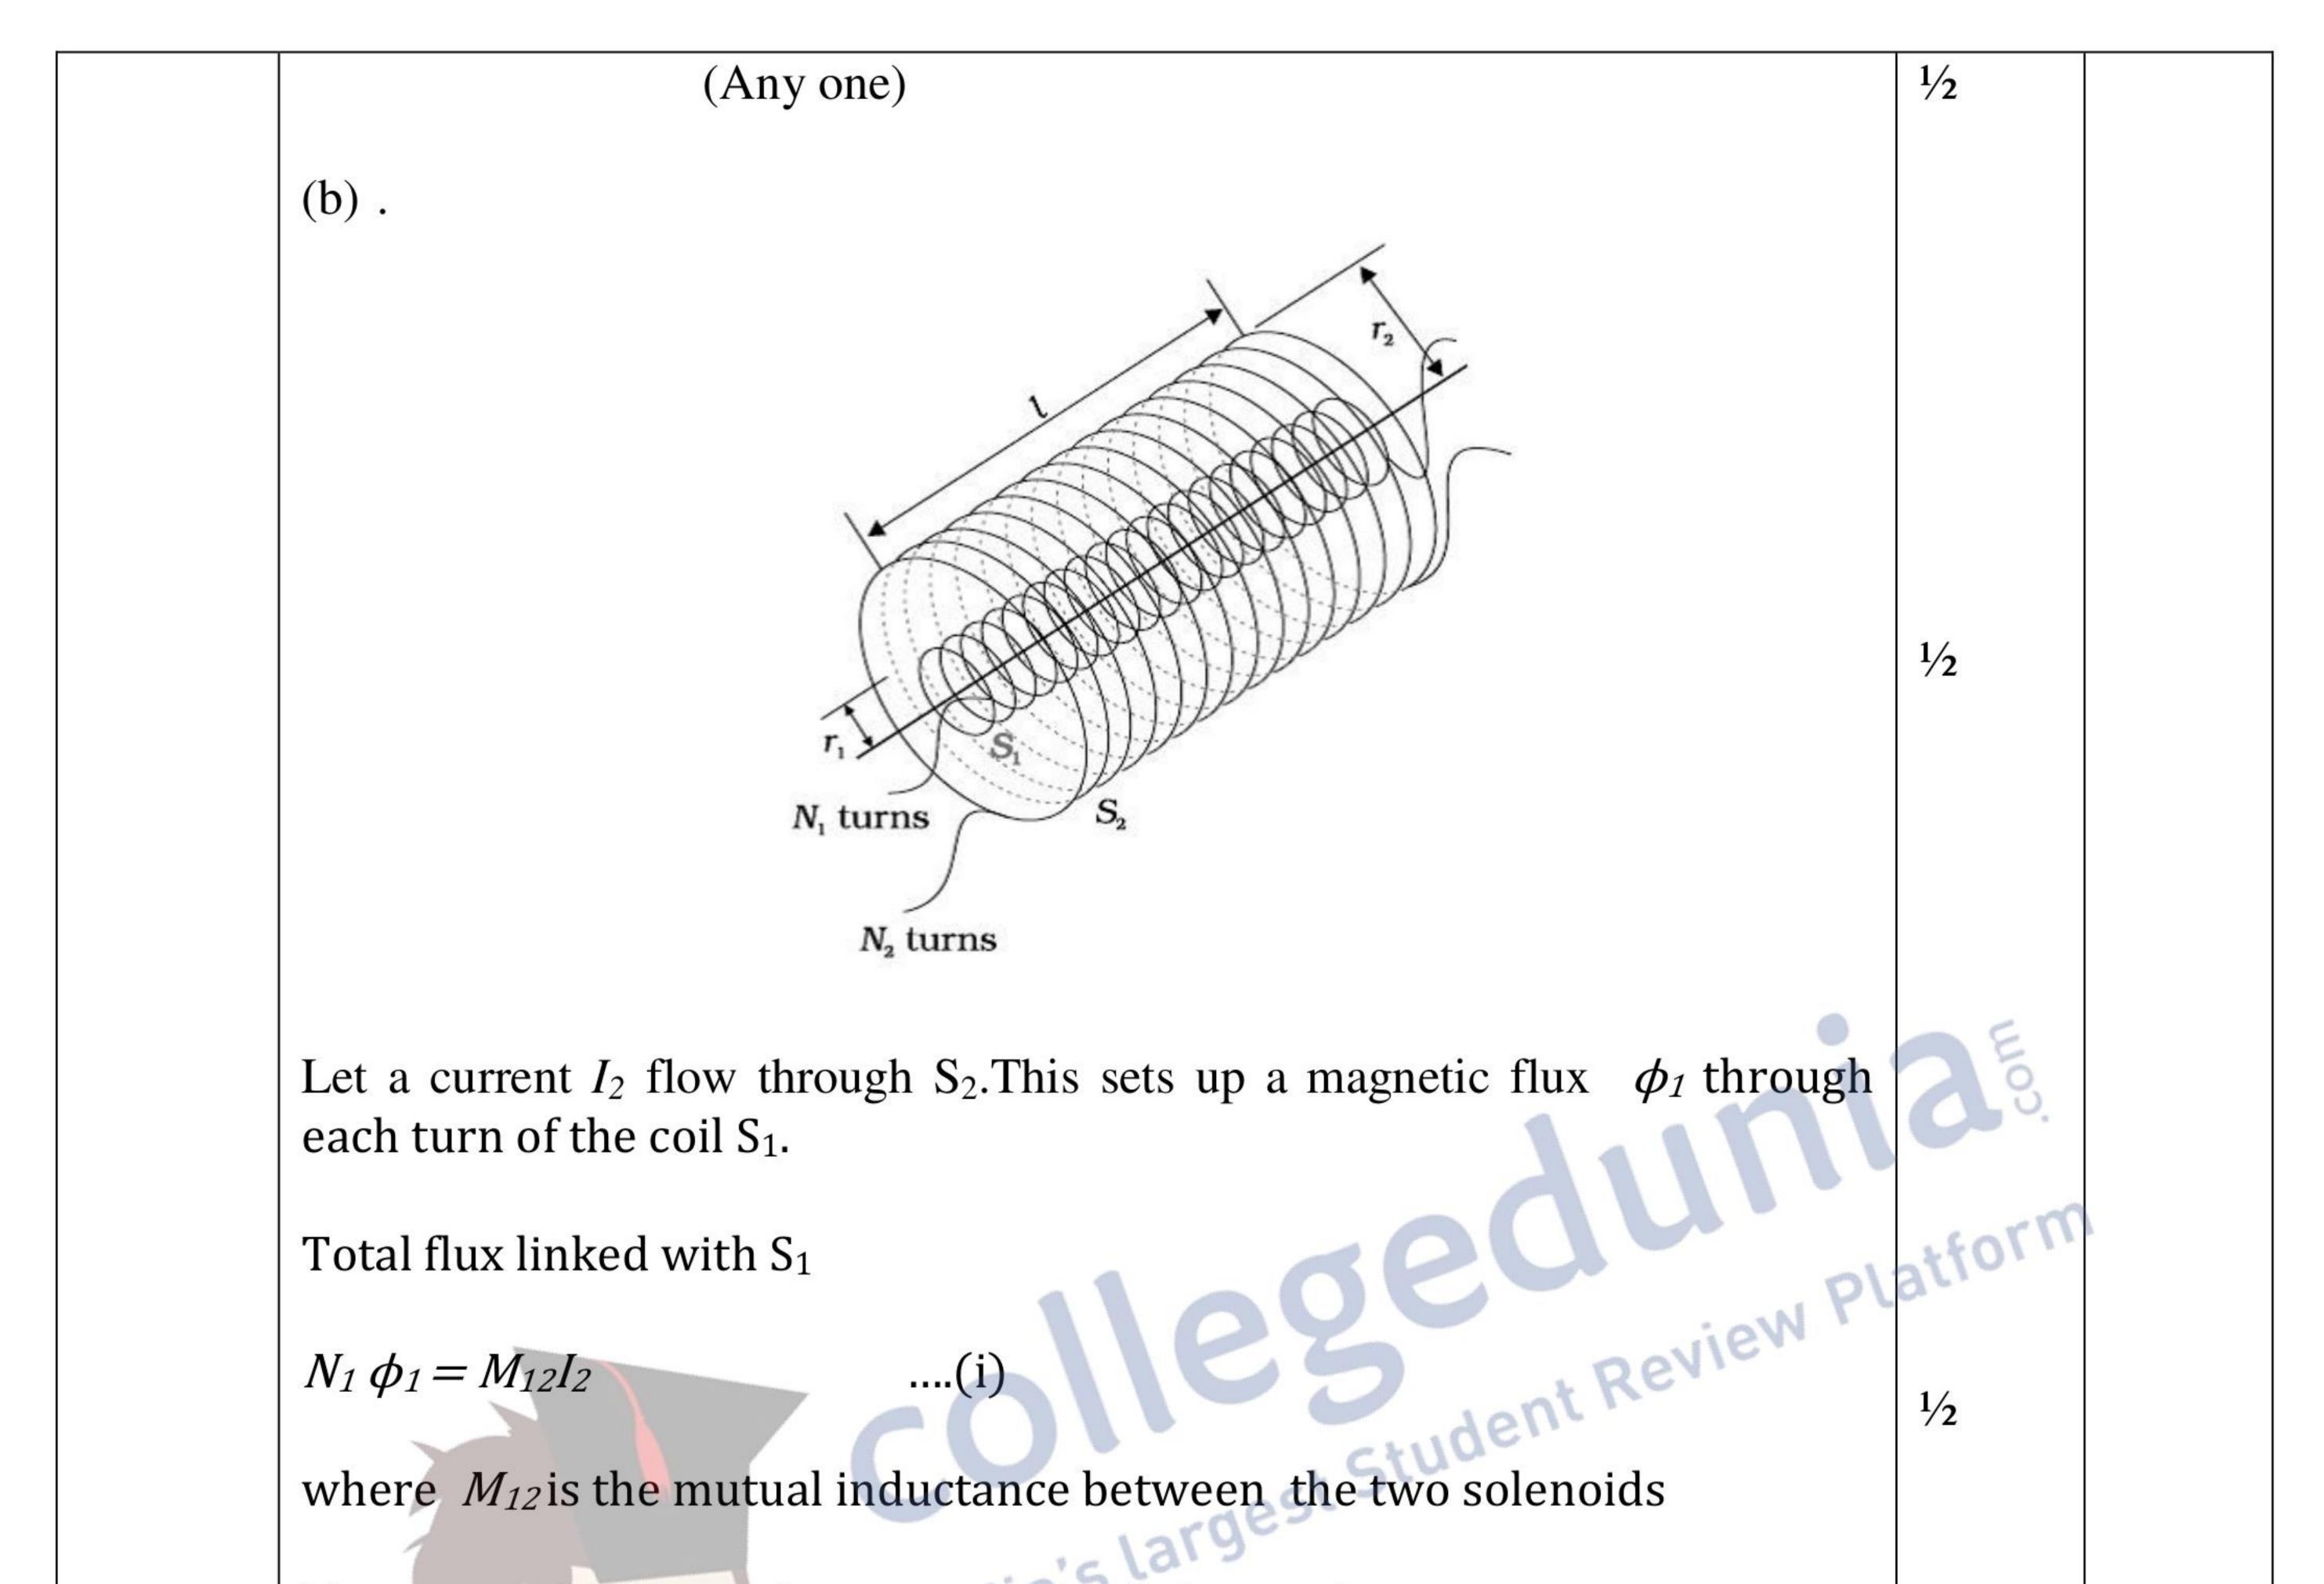

SI unit : henry / (Weber ampere⁻¹) / (volt second ampere⁻¹)

Page 15 of 23

Final Draft

17/03/15 4:30 p.m.

Magnetic field due to the current I_2 in S_2 is $\mu_0 n_2 I_2$.

Therefore, resulting flux linked with S₁.

 $N_1 \phi_1 = [(n_1 \ell) \pi r_1^2](\mu_0 n_2 I_2)$(ii)

Comparing (i) & (ii),we get

 $M_{12}I_2 = (n_1\ell)\pi r_1^2(\mu_0 n_2 I_2)$

 $\therefore M_{12} = \mu_0 n_1 n_2 \pi r_1^2 \ell$

(c) Let a magnetic flux be (ϕ_1) linked with coil C₁ due to current (I_2) in coil C_2 ;

We have :

		$\phi_1 \propto I_2$			
		$\Rightarrow \phi_1 = MI_2$

 $1/_{2}$

the screen, as the resultant effect of the superposition of its wavelets like LM, MM_2 , M_2N . These have to be superposed taking into account their proper phase differences .We, therefore,get maxima and minima ,i.e a diffraction pattern, on the screen.

(b)

Condition for first minimum on the screen

 $\frac{1}{2}$

$a \sin \theta = \lambda$ $\Rightarrow \theta = \lambda/a$	1/2	
∴ angular widthof the central fringe on the screen (from figure)		

Page 17 of 23 Final Draft 17/03/15 4:30 p.m.

$= 2 \theta = 2 \lambda/a$	1/2	
Angular width of first diffraction fringe (From fig) = λ/a	1⁄2	
Hence angular width of central fringe is twice the angular width of first fringe.		
Maxima become weaker and weaker with increasing n. This is because the effective part of the wavefront, contributing to the maxima, becomes smaller and smaller, with increasing n.	1	5

(Deduct ¹/₂ mark for not showing direction of propagation of ray)

For small angles

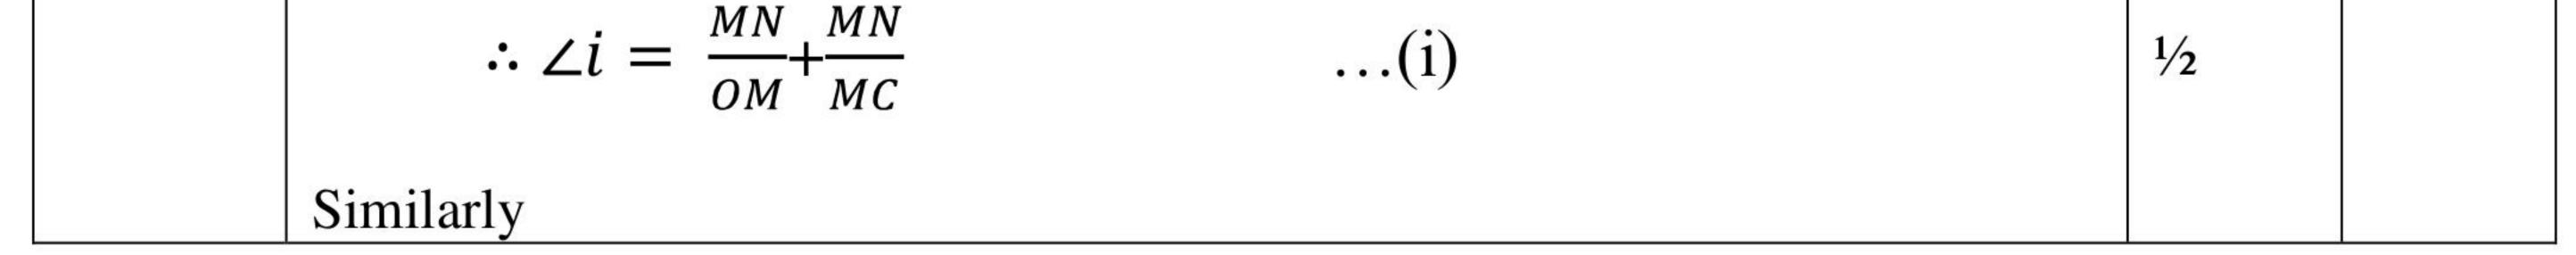

$$\angle NOM \simeq \tan \angle NOM = \frac{MN}{OM}$$

$$\angle NCM \simeq \tan \angle NCM = \frac{MN}{MC}$$

$$\angle NIM \simeq \tan \angle NIM = \frac{MN}{MI}$$

In ΔNOC , $\angle i \angle NOM + \angle NCM$

Page 21 of 23

Final Draft

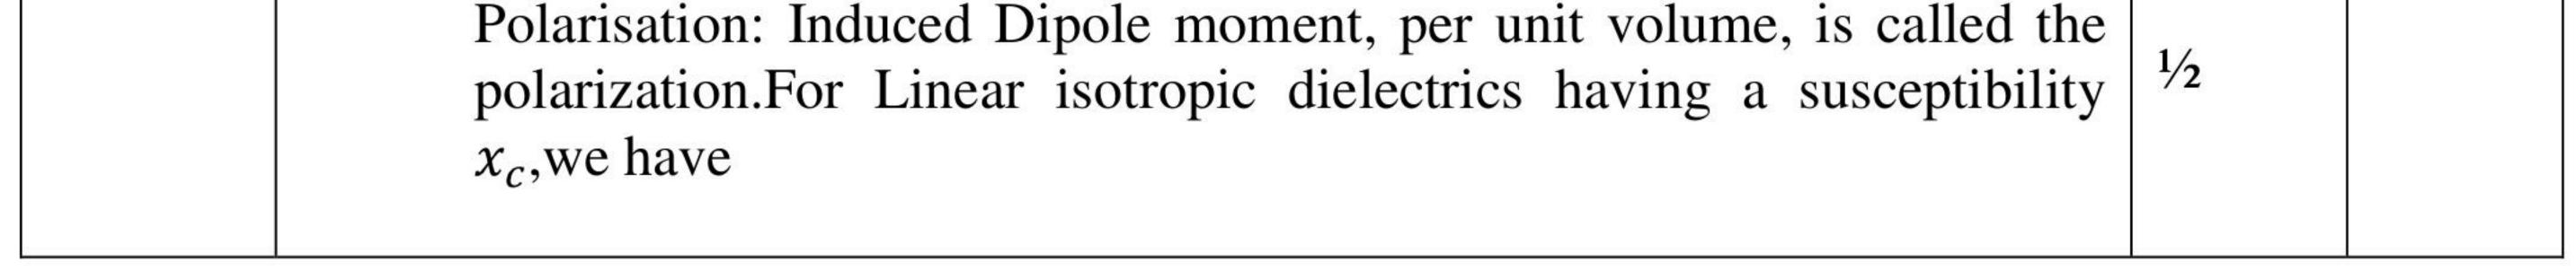

17/03/15 4:30 p.m.

In the presence of Electric field, the free charge carriers, in a conductor, move the charge distribution in the conductor readjusts itself so that the net Electric field within the conductor becomes zero.

In a dielectric, the external Electric field induces a net dipole moment, $\frac{1}{2}$ by stretching /reorienting the molecules. The Electric field, due to this induced dipole moment, opposes, but does not exactly cancel, the external Electric field.
