Answer (1)

Sol.

In prism,
$$r_1 + c = A$$

$$r_1 = 90^{\circ} - c$$
 ...(1)

$$\sin c = \frac{1}{\mu}$$
 \Rightarrow $\cos c = \frac{\sqrt{\mu^2 - 1}}{\mu}$

⇒ Apply Snell's law, on incidence surface

$$1 \cdot \sin 30^{\circ} = \mu \sin(r_1) \Rightarrow 1 \times \frac{1}{2} = \mu \times \sin(90^{\circ} - c)$$

$$\frac{1}{2} = \mu \times \frac{\sqrt{\mu^2 - 1}}{\mu}$$

$$\Rightarrow \frac{1}{4} = 2\pi\sqrt{\frac{9.8 \times 10^{-6}}{M \times 0.049}}$$

$$\Rightarrow \frac{1}{16} = 4\pi^2 \times \frac{9.8 \times 10^{-6}}{M \times 49 \times 10^{-3}}$$

$$\Rightarrow \frac{1}{4} = 2\pi \sqrt{\frac{9.8 \times 10^{-6}}{M \times 0.049}}$$

$$\Rightarrow \frac{1}{16} = 4\pi^2 \times \frac{9.8 \times 10^{-6}}{M \times 49 \times 10^{-3}}$$

$$\Rightarrow M = \frac{4\pi^2 \times 9.8 \times 10^{-6}}{49 \times 10^{-3}} \times 16$$

$$= \frac{4\pi^2 \times 9.8 \times 16 \times 10^{-3}}{49}$$

=
$$12.8\pi^2 \times 10^{-3} \times 10^{-2} \times 10^2$$

- (1) Reaction has a tendency to go in forward direction.
- (2) Reaction has a tendency to go in backward direction.
- (3) Reaction has gone to completion in forward direction.
- (4) Reaction is at equilibrium.

Answer (2)

Sol.
$$2A \rightleftharpoons B + C$$

62. Given below are two statements:

Statement I: The boiling point of three isomeric pentanes follows the order

n-pentane > isopentane > neopentane

Statement II: When branching increases, the molecule attains a shape of sphere. This results in smaller surface area for contact, due to which the intermolecular forces between the spherical molecules are weak, thereby lowering the boiling point.

In the light of the above statements, choose the *most appropriate* answer from the options given below:

- (1) Both Statement I and Statement II are incorrect
- (2) Statement I is correct but Statement II is incorrect
- (3) Statement I is incorrect but Statement II is correct

Answer (4)

Sol. In [Co(NH₃)₆]³⁺, Co³⁺ ion is having 3d⁶ configuration.

Electronic configuration of Co³⁺: 1 1 1 1 1 3d 4s 4p

In presence of NH₃ ligand, pairing of electrons takes place and it becomes diamagnetic complex ion.

In presence of NH₃ ligand : 11 11 11 13 14 15 19

.: [Co(NH₃)₆]³⁺ is octahedral with d²sp³ hybridisation and it is diamagnetic in nature.

In case of [CoF₆]³⁻, Co is in +3 oxidation state and it is having 3d⁶ configuration.

In presence of weak field F-ligand, pairing does not take place.

: In [CoF₆]³⁻, Co³⁺ is sp³d² hybridised with four unpaired electrons, so it is paramagnetic in nature.

 - (1) 250 mg

(2) Zero mg

(3) 200 mg

(4) 750 mg
×25

Answer (1)

$$\textbf{Sol.} \quad M = \frac{W \times 1000}{M_2 \times V \text{ (in mL)}}$$

$$W = \frac{M \times M_2 \times V \text{ (in mL)}}{1000} = \frac{0.75 \times 36.5 \times 25}{1000}$$

= 0.684 g (Mass of HCI)

$$HCI+NaOH\longrightarrow HCI+NaOH$$
36.5 g 40 g

36.5 g HCl reacts with NaOH = 40 g

0.684 g HCl reacts with NaOH = $\frac{40}{36.5} \times 0.684 \approx 0.750$ g

Amount of NaOH left = 1 g - 0.750 g = 0.250 g = 250 mg

79. Given below are two statements:

Statement I: The boiling point of hydrides of Group 16 elements follow the order

 $H_2O > H_2Te > H_2Se > H_2S$.

Statement II: On the basis of molecular mass, H_2O is expected to have lower boiling point than the other members of the group but due to the presence of extensive H-bonding in H_2O , it has higher boiling point.

In the light of the above statements, choose the correct answer from the options given below:

- (1) Both Statement I and Statement II are false
- (2) Statement I is true but Statement II is false
- (3) Statement I is false but Statement II is true
- (4) Both Statement I and Statement II are true

Answer (4)

Sol. Statement I is correct, because boiling point of hydrides of group 16 follows the order

Statement II due to intermolecular H-bonding H₂O shows higher boiling point than respective hydrides of group 16.

(Both Statement are true)

Order from H₂Te to H₂S is due to decreasing molar mass.

Sol. The correct answer is option (2) as statement I is correct but statement II is incorrect.

In human brain, a deep cleft divides the cerebrum longitudinally into two halves, which are termed as the left and right cerebral hemispheres. The cerebral hemispheres are connected by a tract of nerve fibres called corpus callosum.

Three major regions make up the brain stem i.e. mid brain, pons and medulla oblongata.

Cerebrum is a part of forebrain which does not form brain stem.

- 198. Regarding catalytic cycle of an enzyme action, select the correct sequential steps:
 - A. Substrate enzyme complex formation.
 - B. Free enzyme ready to bind with another substrate.
 - C. Release of products.
 - D. Chemical bonds of the substrate broken.
 - Substrate binding to active site.

Choose the correct answer from the options given below:

(1) A, E, B, D, C

(2) B. A. C. D. E

(3) E, D, C, B, A

(4) E, A, D, C, B

Answer (4)

Sol. The correct answer is option (4) which is E, A, D, C, B.

The catalytic cycle of an enzyme action can be described in the following steps.

- (1) The binding of the substrate induces the enzyme to alter its shape, fitting more tightly around the substrate.
- (2) The active site of the enzyme, now in close proximity of the substrate breaks the chemical bonds of the substrate and the new enzyme-product complex is formed.
- (3) The enzyme releases the products of the reaction and the free enzyme is ready to bind to another molecule of the substrate and run through the catalytic cycle once again.
- (4) First, the substrate binds to the active site of the enzyme, fitting into the active site.

Options (1), (2) and (3) are incorrect as the steps mentioned are in the wrong sequence.

199. Given below are two statements:

Statement I: Mitochondria and chloroplasts both double membranes bound organelles.

Statement II: Inner membrane of mitochondria is relatively less permeable, as compared chloroplast.

In the light of the above statements, choose the mis appropriate answer from the options given below:

- (2) Statement I is correct but Statement II is incorrect.
- (3) Statement I is incorrect but Statement II is correct.
- (4) Both Statement I and Statement II are correct.

Answer (2)

Sol. Both mitochondria and chloroplasts are double membrane bound cell organelles.

Transport of ions occurs across the inner membrane of mitochondria. The inner membrane of chloroplast is impermeable to ions and metabolites. Therefore, it is said that inner membrane of mitochondria is relatively more permeable to that of chloroplast.
